Catalyst 2950 and Catalyst 2955 Switch Software Configuration Guide

Cisco IOS Release 12.1(22)EA11 and Later
March 2008
CONTENTS

Preface xxvii
  Audience xxvii
  Purpose xxvii
  Conventions xxviii
  Related Publications xxix
  Obtaining Documentation and Submitting a Service Request xxx

CHAPTER 1

Overview 1-1
  Features 1-1
    Ease of Deployment and Ease of Use 1-2
    Performance 1-3
    Manageability 1-4
    Redundancy 1-5
    VLAN Support 1-6
    Security 1-6
    Quality of Service and Class of Service 1-7
    Monitoring 1-8
    LRE Features (available only on Catalyst 2950 LRE switches) 1-8
  Management Options 1-9
    Management Interface Options 1-9
    Advantages of Using Network Assistant and Clustering Switches 1-10
  Network Configuration Examples 1-11
    Design Concepts for Using the Switch 1-11
    Small to Medium-Sized Network Configuration 1-14
    Collapsed Backbone and Switch Cluster Configuration 1-15
    Hotel Network Configuration 1-16
    Service-Provider Central-Office Configuration 1-18
    Large Campus Configuration 1-20
    Multidwelling Network Using Catalyst 2950 Switches 1-21
    Long-Distance, High-Bandwidth Transport Configuration 1-23
  Where to Go Next 1-23
CHAPTER 2

Using the Command-Line Interface 2-1
Cisco IOS Command Modes 2-1
Getting Help 2-3
Abbreviating Commands 2-4
Using no and default Forms of Commands 2-4
Understanding CLI Messages 2-5
Using Command History 2-5
Changing the Command History Buffer Size 2-5
Recalling Commands 2-6
Disabling the Command History Feature 2-6
Using Editing Features 2-6
Enabling and Disabling Editing Features 2-6
Editing Commands through Keystrokes 2-7
Editing Command Lines that Wrap 2-8
Searching and Filtering Output of show and more Commands 2-9
Accessing the CLI 2-9

CHAPTER 3

Configuring Catalyst 2955 Switch Alarms 3-1
Understanding Catalyst 2955 Switch Alarms 3-1
Global Status Monitoring Alarms 3-2
FCS Error Hysteresis Threshold 3-2
Port Status Monitoring Alarms 3-3
Triggering Alarm Options 3-3
Configuring Catalyst 2955 Switch Alarms 3-4
Default Catalyst 2955 Switch Alarm Configuration 3-4
Configuring the Power Supply Alarm 3-5
Setting the Power Mode 3-5
Setting the Power Supply Alarm Options 3-5
Configuring the Switch Temperature Alarms 3-6
Setting a Secondary Temperature Threshold for the Switch 3-6
Associating the Temperature Alarms to a Relay 3-7
Configuring the FCS Bit Error Rate Alarm 3-7
Setting the FCS Error Threshold 3-8
Setting the FCS Error Hysteresis Threshold 3-8
Configuring Alarm Profiles 3-9
    Creating or Modifying an Alarm Profile 3-9
    Attaching an Alarm Profile to a Specific Port 3-10
    Enabling SNMP Traps 3-11
Displaying Catalyst 2955 Switch Alarms Status 3-11

CHAPTER 4  Assigning the Switch IP Address and Default Gateway 4-1
    Understanding the Boot Process 4-1
    Assigning Switch Information 4-2
        Default Switch Information 4-3
        Understanding DHCP-Based Autoconfiguration 4-3
            DHCP Client Request Process 4-4
        Configuring DHCP-Based Autoconfiguration 4-5
            DHCP Server Configuration Guidelines 4-5
        Configuring the TFTP Server 4-6
        Configuring the DNS 4-7
        Configuring the Relay Device 4-7
        Obtaining Configuration Files 4-8
        Example Configuration 4-9
    Understanding DHCP-Based Autoconfiguration with a Saved Configuration 4-10
        Limitations and Restrictions 4-10
    Configuring DHCP-Based Autoconfiguration with a saved configuration 4-11
    Manually Assigning IP Information 4-12
    Checking and Saving the Running Configuration 4-12
    Modifying the Startup Configuration 4-13
        Default Boot Configuration 4-13
        Automatically Downloading a Configuration File 4-13
        Specifying the Filename to Read and Write the System Configuration 4-14
        Booting Manually 4-14
        Booting a Specific Software Image 4-15
        Controlling Environment Variables 4-16
    Scheduling a Reload of the Software Image 4-17
        Configuring a Scheduled Reload 4-18
        Displaying Scheduled Reload Information 4-19

CHAPTER 5  Configuring Cisco IOS CNS Agents 5-1
    Understanding Cisco Configuration Engine Software 5-1
        Configuration Service 5-2
Contents

Event Service 5-3
  NameSpace Mapper 5-3
What You Should Know About the CNS IDs and Device Hostnames 5-3
  ConfigID 5-4
  DeviceID 5-4
  Hostname and DeviceID 5-4
  Using Hostname, DeviceID, and ConfigID 5-5
Understanding Cisco IOS Agents 5-5
  Initial Configuration 5-5
  Incremental (Partial) Configuration 5-6
  Synchronized Configuration 5-6
Configuring Cisco IOS Agents 5-7
  Enabling Automated CNS Configuration 5-7
  Enabling the CNS Event Agent 5-8
  Enabling the Cisco IOS CNS Agent 5-9
  Enabling an Initial Configuration 5-9
  Enabling a Partial Configuration 5-11
Displaying CNS Configuration 5-12

Chapter 6

Clustering Switches 6-1
Understanding Switch Clusters 6-1
  Cluster Command Switch Characteristics 6-2
  Standby Cluster Command Switch Characteristics 6-3
  Candidate Switch and Member Switch Characteristics 6-4
Planning a Switch Cluster 6-4
  Automatic Discovery of Cluster Candidates and Members 6-5
    Discovery Through CDP Hops 6-5
    Discovery Through Non-CDP-Capable and Noncluster-Capable Devices 6-6
    Discovery Through Different VLANs 6-7
    Discovery Through Different Management VLANs 6-7
    Discovery of Newly Installed Switches 6-8
  HSRP and Standby Cluster Command Switches 6-9
    Virtual IP Addresses 6-10
    Other Considerations for Cluster Standby Groups 6-10
    Automatic Recovery of Cluster Configuration 6-11
  IP Addresses 6-12
  Hostnames 6-12
  Passwords 6-12
  SNMP Community Strings 6-13
Contents

6-13

TACACS+ and RADIUS

6-13

LRE Profiles

6-13

Catalyst 1900 and Catalyst 2820 CLI Considerations

6-14

Using SNMP to Manage Switch Clusters

6-14

Catalyst 2950 and Catalyst 2955 Switch Software Configuration Guide

vii
Configuring MAC Address Notification Traps  7-21
Adding and Removing Static Address Entries  7-23
Configuring Unicast MAC Address Filtering  7-24
Displaying Address Table Entries  7-25
Managing the ARP Table  7-26

CHAPTER 8
Configuring Switch-Based Authentication  8-1
Preventing Unauthorized Access to Your Switch  8-1
Protecting Access to Privileged EXEC Commands  8-2
  Default Password and Privilege Level Configuration  8-2
  Setting or Changing a Static Enable Password  8-3
  Protecting Enable and Enable Secret Passwords with Encryption  8-4
Disabling Password Recovery  8-5
Setting a Telnet Password for a Terminal Line  8-6
Configuring Username and Password Pairs  8-7
Configuring Multiple Privilege Levels  8-8
  Setting the Privilege Level for a Command  8-8
  Changing the Default Privilege Level for Lines  8-9
Logging into and Exiting a Privilege Level  8-10
Controlling Switch Access with TACACS+  8-10
  Understanding TACACS+  8-10
  TACACS+ Operation  8-12
Configuring TACACS+  8-12
  Default TACACS+ Configuration  8-13
  Identifying the TACACS+ Server Host and Setting the Authentication Key  8-13
  Configuring TACACS+ Login Authentication  8-14
  Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services  8-16
  Starting TACACS+ Accounting  8-16
Displaying the TACACS+ Configuration  8-17
Controlling Switch Access with RADIUS  8-17
  Understanding RADIUS  8-17
  RADIUS Operation  8-19
Chapter 8
Configuring RADIUS 8-19
  Default RADIUS Configuration 8-20
  Identifying the RADIUS Server Host 8-20
  Configuring RADIUS Login Authentication 8-23
  Defining AAA Server Groups 8-25
  Configuring RADIUS Authorization for User Privileged Access and Network Services 8-27
  Starting RADIUS Accounting 8-28
  Configuring Settings for All RADIUS Servers 8-28
  Configuring the Switch to Use Vendor-Specific RADIUS Attributes 8-29
  Configuring the Switch for Vendor-Proprietary RADIUS Server Communication 8-30
  Displaying the RADIUS Configuration 8-31
Configuring the Switch for Local Authentication and Authorization 8-32
Configuring the Switch for Secure Shell 8-33
  Understanding SSH 8-33
    SSH Servers, Integrated Clients, and Supported Versions 8-33
    Limitations 8-34
  Configuring SSH 8-34
    Configuration Guidelines 8-34
    Cryptographic Software Image Guidelines 8-35
    Setting Up the Switch to Run SSH 8-35
    Configuring the SSH Server 8-36
    Displaying the SSH Configuration and Status 8-37

Chapter 9
Configuring IEEE 802.1x Port-Based Authentication 9-1
  Understanding IEEE 802.1x Port-Based Authentication 9-1
    Device Roles 9-2
    Authentication Initiation and Message Exchange 9-3
    Ports in Authorized and Unauthorized States 9-4
    IEEE 802.1x Host Mode 9-5
    IEEE 802.1x Accounting 9-6
    IEEE 802.1x Accounting Attribute-Value Pairs 9-6
    Using IEEE 802.1x Authentication with VLAN Assignment 9-7
    Using IEEE 802.1x Authentication with Guest VLAN 9-8
    Using IEEE 802.1x Authentication with Restricted VLAN 9-9
    Using IEEE 802.1x Authentication with Voice VLAN Ports 9-10
    Using IEEE 802.1x Authentication with Port Security 9-10
    Using IEEE 802.1x Authentication with Wake-on-LAN 9-11
    Network Admission Control Layer 2 IEEE 802.1x Validation 9-11
Configuring IEEE 802.1x Authentication 9-12
  Default IEEE 802.1x Authentication Configuration 9-12
  IEEE 802.1x Authentication Configuration Guidelines 9-13
  IEEE 802.1x Authentication 9-14
  VLAN Assignment, Guest VLAN, and Restricted VLAN 9-14
Upgrading from a Previous Software Release 9-15
Configuring IEEE 802.1x Authentication 9-15
Configuring the Switch-to-RADIUS-Server Communication 9-17
Configuring the Host Mode 9-18
Enabling Periodic Re-Authentication 9-19
Manually Re-Authenticating a Client Connected to a Port 9-19
Changing the Quiet Period 9-20
Changing the Switch-to-Client Retransmission Time 9-20
Setting the Switch-to-Client Frame-Retransmission Number 9-21
Configuring IEEE 802.1x Accounting 9-22
Configuring a Guest VLAN 9-23
Configuring a Restricted VLAN 9-24
Configuring IEEE 802.1x Authentication with WoL 9-26
Configuring NAC Layer 2 IEEE 802.1x Validation 9-27
Resetting the IEEE 802.1x Configuration to the Default Values 9-28
Displaying IEEE 802.1x Statistics and Status 9-28

CHAPTER 10 Configuring Interface Characteristics 10-1

Understanding Interface Types 10-1
  Access Ports 10-2
  Trunk Ports 10-2
  Port-Based VLANs 10-3
  EtherChannel Port Groups 10-3
  Connecting Interfaces 10-4
Using the Interface Command 10-4
  Procedures for Configuring Interfaces 10-5
  Configuring a Range of Interfaces 10-5
  Configuring and Using Interface-Range Macros 10-7
Configuring Ethernet Interfaces 10-8
  Default Ethernet Interface Configuration 10-9
  Configuring Interface Speed and Duplex Mode 10-10
    Configuration Guidelines 10-10
    Setting the Interface Speed and Duplex Parameters on a Non-LRE Switch Port 10-12
    Setting the Interface Speed and Duplex Parameters on an LRE Switch Port 10-12

Contents

Using Rate Selection to Automatically Assign Profiles 12-14
  Precedence 12-15
  Profile Locking 12-15
  Link Qualification and SNR Margins 12-16
Configuring LRE Link Persistence 12-19
Configuring LRE Link Monitor 12-19
Configuring LRE Interleave 12-19
Configuring Upstream Power Back-Off 12-20
Configuring CPE Toggle 12-21
Configuring Syslog Export 12-22
Upgrading LRE Switch Firmware 12-23
  Configuring for an LRE Upgrade 12-23
  Performing an LRE Upgrade 12-24
    Global Configuration of LRE Upgrades 12-24
    Controller Configuration of LRE Upgrades 12-24
  LRE Upgrade Details 12-25
    LRE Upgrade Example 12-26
Displaying LRE Status 12-27

CHAPTER 13
Configuring STP 13-1

Understanding Spanning-Tree Features 13-1
  STP Overview 13-2
  Spanning-Tree Topology and BPDUs 13-2
  Bridge ID, Switch Priority, and Extended System ID 13-3
  Spanning-Tree Interface States 13-4
    Blocking State 13-5
    Listening State 13-6
    Learning State 13-6
    Forwarding State 13-6
    Disabled State 13-6
  How a Switch or Port Becomes the Root Switch or Root Port 13-7
  Spanning Tree and Redundant Connectivity 13-7
  Spanning-Tree Address Management 13-8
  Accelerated Aging to Retain Connectivity 13-8
  Spanning-Tree Modes and Protocols 13-9
  Supported Spanning-Tree Instances 13-9
  Spanning-Tree Interoperability and Backward Compatibility 13-10
  STP and IEEE 802.1Q Trunks 13-10
Configuring Spanning-Tree Features  13-10
  Default Spanning-Tree Configuration  13-11
  Spanning-Tree Configuration Guidelines  13-11
  Changing the Spanning-Tree Mode  13-12
  Disabling Spanning Tree  13-13
  Configuring the Root Switch  13-14
  Configuring a Secondary Root Switch  13-16
  Configuring the Port Priority  13-17
  Configuring the Path Cost  13-18
  Configuring the Switch Priority of a VLAN  13-19
  Configuring Spanning-Tree Timers  13-20
    Configuring the Hello Time  13-20
    Configuring the Forwarding-Delay Time for a VLAN  13-21
    Configuring the Maximum-Aging Time for a VLAN  13-21

  Configuring Spanning Tree for Use in a Cascaded Stack  13-22

Displaying the Spanning-Tree Status  13-23

CHAPTER 14

Configuring MSTP  14-1

Understanding MSTP  14-2
  Multiple Spanning-Tree Regions  14-2
  IST, CIST, and CST  14-2
    Operations Within an MST Region  14-3
    Operations Between MST Regions  14-3
  Hop Count  14-4
  Boundary Ports  14-5
  Interoperability with IEEE 802.1D STP  14-5

Understanding RSTP  14-6
  Port Roles and the Active Topology  14-6
  Rapid Convergence  14-7
  Synchronization of Port Roles  14-8
  Bridge Protocol Data Unit Format and Processing  14-9
    Processing Superior BPDU Information  14-10
    Processing Inferior BPDU Information  14-10
  Topology Changes  14-10

Configuring MSTP Features  14-11
  Default MSTP Configuration  14-11
  MSTP Configuration Guidelines  14-12
  Specifying the MST Region Configuration and Enabling MSTP  14-13
Chapter 15
Configuring Optional Spanning-Tree Features

Understanding Optional Spanning-Tree Features
Understanding Port Fast
Understanding BPDU Guard
Understanding BPDU Filtering
Understanding UplinkFast
Understanding Cross-Stack UplinkFast
How CSUF Works
Events that Cause Fast Convergence
Limitations
Connecting the Stack Ports
Understanding BackboneFast
Understanding EtherChannel Guard
Understanding Root Guard
Understanding Loop Guard

Configuring Optional Spanning-Tree Features
Default Optional Spanning-Tree Configuration
Optional Spanning-Tree Configuration Guidelines
Enabling Port Fast
Enabling BPDU Guard
Enabling BPDU Filtering
Enabling UplinkFast for Use with Redundant Links
Enabling Cross-Stack UplinkFast
Enabling BackboneFast
Enabling EtherChannel Guard
Enabling Root Guard 15-20
Enabling Loop Guard 15-20
Displaying the Spanning-Tree Status 15-21

CHAPTER 16

Configuring VLANs 16-1

Understanding VLANs 16-1
  Supported VLANs 16-2
  VLAN Port Membership Modes 16-3
Configuring Normal-Range VLANs 16-4
  Token Ring VLANs 16-5
  Normal-Range VLAN Configuration Guidelines 16-5
  VLAN Configuration Mode Options 16-6
    VLAN Configuration in config-vlan Mode 16-6
    VLAN Configuration in VLAN Configuration Mode 16-6
Saving VLAN Configuration 16-6
Default Ethernet VLAN Configuration 16-7
Creating or Modifying an Ethernet VLAN 16-8
Deleting a VLAN 16-9
Assigning Static-Access Ports to a VLAN 16-10
Configuring Extended-Range VLANs 16-11
  Default VLAN Configuration 16-11
  Extended-Range VLAN Configuration Guidelines 16-11
  Creating an Extended-Range VLAN 16-12
Displaying VLANs 16-13
Configuring VLAN Trunks 16-13
  Trunking Overview 16-14
    IEEE 802.1Q Configuration Considerations 16-15
    Default Layer 2 Ethernet Interface VLAN Configuration 16-16
  Configuring an Ethernet Interface as a Trunk Port 16-16
    Interaction with Other Features 16-16
    Configuring a Trunk Port 16-17
    Defining the Allowed VLANs on a Trunk 16-18
    Changing the Pruning-Eligible List 16-19
    Configuring the Native VLAN for Untagged Traffic 16-19
Load Sharing Using STP 16-20
  Load Sharing Using STP Port Priorities 16-20
  Load Sharing Using STP Path Cost 16-22
CHAPTER 17

Configuring VTP  
Understanding VTP  17-1
   The VTP Domain  17-2
   VTP Modes  17-2
   VTP Advertisements  17-3
   VTP Version 2  17-4
   VTP Pruning  17-4

Configuring VTP  17-5
   Default VTP Configuration  17-6
   VTP Configuration Options  17-6
      VTP Configuration in Global Configuration Mode  17-7
      VTP Configuration in VLAN Configuration Mode  17-7
   VTP Configuration Guidelines  17-8
      Domain Names  17-8
      Passwords  17-8
      Upgrading from Previous Software Releases  17-8
      VTP Version  17-9
         Configuration Requirements  17-9
   Configuring a VTP Server  17-9
   Configuring a VTP Client  17-11
   Disabling VTP (VTP Transparent Mode)  17-12
   Enabling VTP Version 2  17-13
Enabling VTP Pruning 17-14
Adding a VTP Client Switch to a VTP Domain 17-14
Monitoring VTP 17-15

CHAPTER 18
Configuring Voice VLAN 18-1
Understanding Voice VLAN 18-1
Configuring Voice VLAN 18-2
    Default Voice VLAN Configuration 18-2
    Voice VLAN Configuration Guidelines 18-3
    Configuring a Port to Connect to a Cisco 7960 IP Phone 18-3
        Configuring Ports to Carry Voice Traffic in IEEE 802.1Q Frames 18-4
        Configuring Ports to Carry Voice Traffic in IEEE 802.1p Priority-Tagged Frames 18-4
        Overriding the CoS Priority of Incoming Data Frames 18-5
        Configuring the IP Phone to Trust the CoS Priority of Incoming Data Frames 18-5
Displaying Voice VLAN 18-6

CHAPTER 19
Configuring DHCP Features 19-1
Understanding DHCP Features 19-1
    DHCP Server 19-2
    DHCP Relay Agent 19-2
    DHCP Snooping 19-2
    Option-82 Data Insertion 19-3
Configuring DHCP Features 19-5
    Default DHCP Configuration 19-5
    DHCP Snooping Configuration Guidelines 19-6
    Configuring the DHCP Server 19-7
    Enabling DHCP Snooping and Option 82 19-7
Displaying DHCP Information 19-8

CHAPTER 20
Configuring IGMP Snooping and MVR 20-1
Understanding IGMP Snooping 20-1
    IGMP Versions 20-2
    Joining a Multicast Group 20-3
    Leaving a Multicast Group 20-4
    Immediate-Leave Processing 20-5
    IGMP Configurable-Leave Timer 20-5
    IGMP Report Suppression 20-5
    Source-Only Networks 20-6
Configuring IGMP Snooping  20-6
  Default IGMP Snooping Configuration  20-7
  Enabling or Disabling IGMP Snooping  20-7
  Setting the Snooping Method  20-8
  Configuring a Multicast Router Port  20-9
  Configuring a Host Staticaly to Join a Group  20-9
  Enabling IGMP Immediate-Leave Processing  20-10
  Configuring the IGMP Leave Timer  20-10
  Disabling IGMP Report Suppression  20-11
  Disabling IP Multicast-Source-Only Learning  20-12
  Configuring the Aging Time  20-13
Displaying IGMP Snooping Information  20-13
Understanding Multicast VLAN Registration  20-14
  Using MVR in a Multicast Television Application  20-15
Configuring MVR  20-17
  Default MVR Configuration  20-17
  MVR Configuration Guidelines and Limitations  20-17
  Configuring MVR Global Parameters  20-18
  Configuring MVR Interfaces  20-19
Displaying MVR Information  20-20
Configuring IGMP Filtering and Throttling  20-21
  Default IGMP Filtering and Throttling Configuration  20-21
  Configuring IGMP Profiles  20-22
  Applying IGMP Profiles  20-23
  Setting the Maximum Number of IGMP Groups  20-24
  Configuring the IGMP Throttling Action  20-24
Displaying IGMP Filtering and Throttling Configuration  20-25

**CHAPTER 21**

Configuring Port-Based Traffic Control  21-1
  Configuring Storm Control  21-1
    Understanding Storm Control  21-1
    Default Storm Control Configuration  21-2
  Configuring Storm Control and Threshold Levels  21-2
  Configuring Protected Ports  21-4
Configuring Port Blocking 21-5
  Blocking Flooded Traffic on an Interface 21-5
  Resuming Normal Forwarding on a Port 21-6
Configuring Port Security 21-6
  Understanding Port Security 21-6
  Secure MAC Addresses 21-6
  Security Violations 21-7
  Default Port Security Configuration 21-8
  Port Security Configuration Guidelines 21-8
  Enabling and Configuring Port Security 21-9
  Enabling and Configuring Port Security Aging 21-11
Displaying Port-Based Traffic Control Settings 21-13

CHAPTER 22
Configuring UDLD 22-1
  Understanding UDLD 22-1
    Modes of Operation 22-1
    Methods to Detect Unidirectional Links 22-2
  Configuring UDLD 22-3
    Default UDLD Configuration 22-4
    Configuration Guidelines 22-4
    Enabling UDLD Globally 22-5
    Enabling UDLD on an Interface 22-5
    Resetting an Interface Shut Down by UDLD 22-6
  Displaying UDLD Status 22-7

CHAPTER 23

Preface

Audience

This guide is for the networking professional managing the Catalyst 2950 and 2955 switches, hereafter referred to as the switches. Before using this guide, you should have experience working with the Cisco IOS and be familiar with the concepts and terminology of Ethernet and local area networking.

Purpose

This guide provides the information you need to configure software features on your switch. The Catalyst 2950 switch is supported by either the standard software image (SI) or the enhanced software image (EI). The Catalyst 2955 and Catalyst 2950 Long-Reach Ethernet (LRE) switches are supported only by the EI.

The EI provides a richer set of features, including access control lists (ACLs), enhanced quality of service (QoS) features, extended-range VLANs, Remote Switched Port Analyzer (RSPAN), and unicast MAC address filtering. The cryptographic SI and EI provide support for the Secure Shell Protocol (SSP). For a list of switches that support the SI and the EI, see Table 1-1 in Chapter 1, “Overview.”

The Catalyst 2955 switch also supports an additional set of features that are described in Chapter 3, “Configuring Catalyst 2955 Switch Alarms.” The switch has facilities to process alarms related to the temperature, power supply conditions, and status of the Ethernet ports.

Use this guide with other documents for information about these topics:

- Requirements—This guide assumes that you have met the hardware and software requirements and cluster compatibility requirements described in the release notes.
- Start-up information—This guide assumes that you have assigned switch IP information and passwords by using the browser setup program described in the switch hardware installation guide.
- Embedded device manager and Network Assistant graphical user interfaces (GUIs)—This guide does not provide detailed information on the GUIs. However, the concepts in this guide are applicable to the GUI user. For information about the device manager, see the switch online help.
  For information about Network Assistant, see the Getting Started with Cisco Network Assistant, available on Cisco.com.
- Cluster configuration—For information about planning for, creating, and maintaining switch clusters, see the Getting Started with Cisco Network Assistant, available on Cisco.com. For information about the clustering-related command-line interface (CLI) commands, see the command reference for this release.
Conventions

This publication uses these conventions to convey instructions and information:

Command descriptions use these conventions:
- Commands and keywords are in **boldface** text.
- Arguments for which you supply values are in *italic*.
- Square brackets ([ ]) mean optional elements.
- Braces ({ }) group required choices, and vertical bars (|) separate the alternative elements.
- Braces and vertical bars within square brackets ([{ |}]) mean a required choice within an optional element.

Interactive examples use these conventions:
- Terminal sessions and system displays are in **screen** font.
- Information you enter is in **boldface** **screen** font.
- Nonprinting characters, such as passwords or tabs, are in angle brackets (< >).

Notes, cautions, and timesavers use these conventions and symbols:

- **Note** Means reader take note. Notes contain helpful suggestions or references to materials not contained in this manual.

- **Caution** Means reader be careful. In this situation, you might do something that could result equipment damage or loss of data.

- **Timesaver** Means the following will help you solve a problem. The tips information might not be troubleshooting or even an action, but could be useful information.
Related Publications

These documents provide complete information about the switch and are available from this Cisco.com site:

- Release Notes for the Catalyst 2950 and Catalyst 2955 Switches

Note
Switch requirements and procedures for initial configurations and software upgrades tend to change and therefore appear only in the release notes. Before installing, configuring, or upgrading the switch, see the release notes on Cisco.com for the latest information.

For information about the switch, see these documents:
- Catalyst 3550, 2955, 2950, and 2940 Switch System Message Guide
- Catalyst 2950 and Catalyst 2955 Switch Software Configuration Guide
- Catalyst 2950 and Catalyst 2955 Switch Command Reference
- Device manager online help (available on the switch)
- Catalyst 2950 Switch Hardware Installation Guide
- Catalyst 2950 Switch Getting Started Guide
- Regulatory Compliance and Safety Information for the Catalyst 2950 Switch
- Catalyst 2955 Switch Hardware Installation Guide

For information about related products, see these documents:
- Getting Started with Cisco Network Assistant
- Release Notes for Cisco Network Assistant
- Catalyst GigaStack Gigabit Interface Converter Hardware Installation Guide
- CWDM Passive Optical System Installation Note
- 1000BASE-T Gigabit Interface Converter Installation Notes
- Cisco Small Form-Factor Pluggable Modules Installation Notes
- Cisco CWDM GBIC and CWDM SFP Installation Note
- For information about the NAC features, see the Network Admission Control Software Configuration Guide
Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What’s New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the What’s New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.
Overview

This chapter provides these topics about the Catalyst 2950 and Catalyst 2955 switch software:

- Features, page 1-1
- Management Options, page 1-9
- Network Configuration Examples, page 1-11
- Where to Go Next, page 1-24

Note

In this document, IP refers to IP version 4 (IPv4). Layer 3 IP version 6 (IPv6) packets are treated as non-IP packets.

Features

The switch software supports the switches listed in Table 1-1 and in the release notes.

Chapter 1      Overview

Features

Certain Cisco Long-Reach Ethernet (LRE) customer premises equipment (CPE) devices are not supported by certain Catalyst 2950 LRE switches. In Table 1-2, Yes means that the CPE is supported by the switch; No means that the CPE is not supported by the switch.

This section describes the features supported in this release:

Some features require that you have the EI installed on your switch. For a list of the switches that support the EI, see Table 1-1, or see the release notes for this release.

### Ease of Deployment and Ease of Use

The switch ships with these features to make the deployment and use easier:

- Express Setup for quickly configuring a switch for the first time with basic IP information, contact information, switch and Telnet passwords, and Simple Network Management Protocol (SNMP) information through a browser-based program.
- User-defined Smartports macros for creating custom switch configurations for simplified deployment across the network.
- Embedded device manager GUI for configuring and monitoring a single switch through a web browser. For information about launching the device manager, see the getting started guide. For more information about the device manager, see the switch online help.
- Network Assistant application for
  - Simplifying and minimizing switch and switch cluster management from anywhere in your intranet.
Chapter 1      Overview

Features

– Accomplishing multiple configuration tasks from a single window without needing to remember command-line interface (CLI) commands to accomplish specific tasks.
– Interactive guide mode that guides you in configuring complex features such as VLANs, ACLs, and quality of service (QoS).
– Automated configuration wizards that prompt you to provide only the minimum required information to configure complex features such as QoS priorities for video traffic, priority levels for data applications, and security.
– Downloading an image to a switch by using TFTP.
– Applying actions to multiple ports and multiple switches at the same time, such as VLAN and QoS settings, inventory and statistic reports, link- and switch-level monitoring and troubleshooting, and multiple switch software upgrades.
– Viewing a topology of interconnected devices to identify existing switch clusters and eligible switches that can join a cluster and to identify link information between switches.
– Real-time status monitoring of a switch or multiple switches from the LEDs on the front-panel images from the device manager and from Network Assistant.
– Switch clustering technology for
  – Unified configuration, monitoring, authentication, and software upgrade of multiple switches (see the release notes for a list of eligible cluster members).
  – Automatic discovery of candidate switches and creation of clusters of up to 16 switches that can be managed through a single IP address.
  – Extended discovery of cluster candidates that are not directly connected to the command switch.

Note
For the Network Assistant software requirements, and for more information about clustering, see the Getting Started with Cisco Network Assistant, available on Cisco.com. For clustering requirements, including supported Cisco IOS releases, see the release notes for this release.

– Hot Standby Router Protocol (HSRP) for command-switch redundancy. The redundant command switches used for HSRP must have compatible software releases.
– DHCP-base autoconfiguration automatically configures a switch at startup with an IP address.

Performance

– Autosensing of speed on the 10/100 and 10/100/1000 ports and autonegotiation of duplex mode on the 10/100 ports for optimizing bandwidth
– IEEE 802.3x flow control on Gigabit Ethernet ports operating in full-duplex mode
– Fast EtherChannel and Gigabit EtherChannel for enhanced fault tolerance and for providing up to 2 Gbps of bandwidth among switches, routers, and servers
– Support for frames larger than 1500 bytes. These switches support frame sizes from 1500 to 1530 bytes:
  – Catalyst 2950G-12-EI, 2950G-24-EI, 2950G-24-EI-DC, and 2950G-48-EI switches running Cisco IOS Release 12.1(6)EA2 or later
  – Catalyst 2950 LRE switches
  – Catalyst 2955 switches
Features

- Port blocking on forwarding unknown unicast and multicast traffic (available only on the Catalyst LRE switches and on the Catalyst 2950G-12-EI, 2950G-24-EI, 2950G-24-EI-DC, 2950G-48-EI, and 2955 switches)
- Per-port broadcast storm control for preventing faulty end stations from degrading overall system performance with broadcast storms
- Port Aggregation Protocol (PAgP) and Link Aggregation Control Protocol (LACP) for automatic creation of EtherChannel links
- Internet Group Management Protocol (IGMP) snooping for IGMP versions 1, 2, and 3 to limit flooding of IP multicast traffic
- IGMP report suppression for sending only one IGMP report per multicast router query to the multicast devices (supported only for IGMPv1 or IGMPv2 queries)
- Multicast VLAN registration (MVR) to continuously send multicast streams in a multicast VLAN while isolating the streams from subscriber VLANs for bandwidth and security reasons
- IGMP filtering for controlling the set of multicast groups to which hosts on a switch port can belong
- IGMP throttling for configuring the action when the maximum number of entries is in the IGMP forwarding table
- Protected port (private VLAN edge port) option for restricting the forwarding of traffic to designated ports on the same switch
- Dynamic address learning for enhanced security

Manageability

- Cisco Intelligence Engine 2100 (IE2100) Series Cisco Networking Services (CNS) embedded agents for automating switch management, configuration storage and delivery (available only with the EI)
- DHCP-based autoconfiguration for automatically configuring the switch during startup with IP address information and a configuration file that it receives during DHCP-based autoconfiguration

Note: DHCP replaces the Bootstrap Protocol (BOOTP) feature autoconfiguration to ensure retrieval of configuration files by unicast TFTP messages. BOOTP is available in earlier software releases for this switch.

- DHCP server for automatic assignment of IP addresses and other DHCP options to IP hosts (available only on the Catalyst 2955 switch)
- DHCP-Based Autoconfiguration with a saved file
- Address Resolution Protocol (ARP) for identifying a switch through its IP address and its corresponding MAC address
- Unicast MAC address filtering to drop packets with specific source or destination MAC addresses (available only with the EI)
- Cisco Discovery Protocol (CDP) versions 1 and 2 for network topology discovery and mapping between the switch and other Cisco devices on the network
- Network Time Protocol (NTP) for providing a consistent time stamp to all switches from an external source
- Directed unicast requests to a TFTP server for obtaining software upgrades from a TFTP server
Chapter 1  Overview

Features

- Default configuration storage in flash memory to ensure that the switch can be connected to a network and can forward traffic with minimal user intervention
- In-band management access through the embedded device manager through a Netscape Navigator or Internet Explorer session or through Network Assistant
- In-band management access through up to 16 simultaneous Telnet connections for multiple command-line interface (CLI)-based sessions over the network
- In-band management access through up to five simultaneous, encrypted Secure Shell (SSH) connections for multiple CLI-based sessions over the network (only available in the enhanced cryptographic software image)
- In-band management access through SNMP versions 1, 2c, and 3 get and set requests
- Out-of-band management access through the switch console port to a directly-attached terminal or to a remote terminal through a serial connection and a modem

Note  For additional descriptions of the management interfaces, see the “Management Options” section on page 1-9.

Redundancy

- HSRP for command-switch redundancy
- UniDirectional Link Detection (UDLD) on all Ethernet ports for detecting and disabling unidirectional links on fiber-optic interfaces caused by incorrect fiber-optic wiring or port faults
- IEEE 802.1D Spanning Tree Protocol (STP) for redundant backbone connections and loop-free networks.
  - Up to 64 spanning-tree instances supported
  - Per-VLAN spanning-tree plus (PVST+) for load balancing across VLANs
  - Rapid PVST+ for load balancing across VLANs
  - UplinkFast, cross-stack UplinkFast, and BackboneFast for fast convergence after a spanning-tree topology change and for achieving load balancing among redundant uplinks, including Gigabit uplinks and cross-stack Gigabit uplinks
- IEEE 802.1s Multiple Spanning Tree Protocol (MSTP) for grouping VLANs into a spanning-tree instance and for providing multiple forwarding paths for data traffic and load balancing and rapid per-VLAN Spanning-Tree plus (rapid-PVST+), based on the IEEE 802.1w Rapid Spanning Tree Protocol (RSTP) for rapid convergence of the spanning tree by immediately transitioning root and designated ports to the forwarding state
- Optional spanning-tree features available in the PVST+, rapid PVST+, and MSTP modes:
  - Port Fast for eliminating the forwarding delay by enabling a port to immediately transition from the blocking state to the forwarding state
  - BPDU guard for shutting down Port Fast-enabled ports that receive BPDUs
  - BPDU filtering for preventing a Port Fast-enabled port from sending or receiving BPDUs
  - Root guard for preventing switches outside the network core from becoming the spanning-tree root
  - Loop guard for preventing alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link
VLAN Support

- The switches support 250 port-based VLANs for assigning users to VLANs associated with appropriate network resources, traffic patterns, and bandwidth

**Note** The Catalyst 2950-12, Catalyst 2950-24, Catalyst 2950SX-24, Catalyst 2950SX-48-SI, and Catalyst 2950T-48-SI switches support only 128 port-based VLANs.

- The switch supports up to 4094 VLAN IDs to allow service provider networks to support the number of VLANs allowed by the IEEE 802.1Q standard
- IEEE 802.1Q trunking protocol on all ports for network moves, adds, and changes; management and control of broadcast and multicast traffic; and network security by establishing VLAN groups for high-security users and network resources
- VLAN Membership Policy Server (VMPS) for dynamic VLAN membership
- VLAN Trunking Protocol (VTP) pruning for reducing network traffic by restricting flooded traffic to links destined for stations receiving the traffic
- Dynamic Trunking Protocol (DTP) for negotiating trunking on a link between two devices and for negotiating the type of trunking encapsulation (IEEE 802.1Q) to be used
- Voice VLAN for creating subnets for voice traffic from Cisco IP Phones
- VLAN 1 minimization to reduce the risk of spanning-tree loops or storms by allowing VLAN 1 to be disabled on any individual VLAN trunk link. With this feature enabled, no user traffic is sent or received. The switch CPU continues to send and receive control protocol frames.

Security

- Bridge protocol data unit (BPDU) guard for shutting down a Port Fast-configured port when an invalid configuration occurs
- Protected port option for restricting the forwarding of traffic to designated ports on the same switch
- Password-protected access (read-only and read-write access) to management interfaces (device manager, Network Assistant, and CLI) for protection against unauthorized configuration changes
- Port security option for limiting and identifying MAC addresses of the stations allowed to access the port
- Port security aging to set the aging time for secure addresses on a port
- DHCP snooping to filter untrusted DHCP messages between untrusted hosts and DHCP servers (available only with the EI)
- Multilevel security for a choice of security level, notification, and resulting actions
- MAC-based port-level security for restricting the use of a switch port to a specific group of source addresses and preventing switch access from unauthorized stations
- TACACS+, a proprietary feature for managing network security through a TACACS server
- IEEE 802.1x port-based authentication to prevent unauthorized devices from gaining access to the network
- IEEE 802.1x accounting to track network usage
IEEE 802.1x with wake-on-LAN to allow dormant PCs to be powered on based on the receipt of a specific Ethernet frame

IEEE 802.1x with restricted VLAN to provide limited services to users who are IEEE 802.1x compliant, but do not have the credentials to authenticate via the standard IEEE 802.1x processes.

Network Admission Control (NAC) Layer 2 IEEE 802.1x validation of the antivirus condition or posture of endpoint systems or clients before granting the devices network access.

For information about configuring NAC Layer 2 IEEE 802.1x validation, see the “Configuring NAC Layer 2 IEEE 802.1x Validation” section on page 9-27.

Standard and extended IP access control lists (ACLs) for defining security policies (available only with the EI)

Quality of Service and Class of Service

Automatic quality of service (auto-QoS) to simplify the deployment of existing QoS features by classifying traffic and configuring egress queues (only available in the EI)

Classification

- IEEE 802.1p class of service (CoS) with four priority queues on the switch 10/100 and LRE ports and eight priority queues on the Gigabit ports for prioritizing mission-critical and time-sensitive traffic from data, voice, and telephony applications
- IP Differentiated Services Code Point (IP DSCP) and CoS marking priorities on a per-port basis for protecting the performance of mission-critical applications (only available with the EI)
- Flow-based packet classification (classification based on information in the MAC, IP, and TCP/UDP headers) for high-performance quality of service at the network edge, allowing for differentiated service levels for different types of network traffic and for prioritizing mission-critical traffic in the network (only available in the EI)
- Support for IEEE 802.1p CoS scheduling for classification and preferential treatment of high-priority voice traffic
- Trusted boundary (detect the presence of a Cisco IP Phone, trust the CoS value received, and ensure port security. If the IP phone is not detected, disable the trusted setting on the port and prevent misuse of a high-priority queue.)

Policing

- Traffic-policing policies on the switch port for allocating the amount of the port bandwidth to a specific traffic flow
- Policing traffic flows to restrict specific applications or traffic flows to metered, predefined rates
- Up to 60 policers on ingress Gigabit-capable Ethernet ports
  Up to six policers on ingress 10/100 ports
  Granularity of 1 Mbps on 10/100 ports and 8 Mbps on 10/100/1000 ports
- Out-of-profile markdown for packets that exceed bandwidth utilization limits

Note: Policing is available only in the EI.

Egress Policing and Scheduling of Egress Queues—Four egress queues on all switch ports. Support for strict priority and weighted round-robin (WRR) CoS policies
Monitoring

- Switch LEDs that show port and switch status
- Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) for traffic monitoring on any port or VLAN

**Note**  RSPAN is available only in the EI.

- SPAN support of Intrusion Detection Systems (IDSs) to monitor, repel, and report network security violations
- Four groups (history, statistics, alarms, and events) of embedded remote monitoring (RMON) agents for network monitoring and traffic analysis
- MAC address notification for tracking the MAC addresses that the switch has learned or removed
- Syslog facility for logging system messages about authentication or authorization errors, resource issues, and time-out events
- Layer 2 traceroute to identify the physical path that a packet takes from a source device to a destination device
- Facilities for processing alarms related to temperature, power-supply conditions, and the status of the Ethernet ports (available only on the Catalyst 2955 switch)

LRE Features (available only on Catalyst 2950 LRE switches)

- Data, voice, and video transmission through categorized and noncategorized unshielded twisted-pair cable (Category 1, 2, and 3 structured and unstructured cable, such as existing telephone lines) in multi-unit, multidwelling, and multitenant buildings
- Up to 15 Mbps of bandwidth to remote Ethernet devices at distances of up to 4921 feet (1500 meters) on each switch LRE port
- Compliance with American National Standards Institute (ANSI) and European Telecommunication Standards Institute (ETSI) standards for spectral-mode compatibility with asymmetric digital subscriber line (ADSL), Integrated Services Digital Network (ISDN), and digital telephone networks
- Configuration and monitoring of connections between:
  - Switch LRE ports and the Ethernet ports on remote LRE customer premises equipment (CPE) devices, such as the Cisco 575 LRE CPE or the Cisco 585 LRE CPE
  - CPE Ethernet ports and remote Ethernet devices, such as a PC
- Support for connecting to the public switched telephone network (PSTN) through plain old telephone service (POTS) splitters such as the Cisco LRE 48 POTS Splitter
- Support for the rate selection, a utility that allows for automatic selection of transmission rates through sequences
- Support for Reed-Solomon error correction
- Support for a protected port on Cisco 585 CPE devices
- Support for small form-factor pluggable (SFP) modules instead of Gigabit Interface Converter (GBIC) modules
Chapter 1  Overview

Management Options

The switch is designed for plug-and-play operation: you only need to assign basic IP information to the switch and connect it to the other devices in your network. If you have specific network needs, you can configure and monitor the switch—on an individual basis or as part of a switch cluster—through its various management interfaces.

Note
For information about assigning an IP address by using the browser-based Express Setup program, see the getting started guide. For information about assigning an IP address by using the CLI-based setup program, see the hardware installation guide.

This section discusses these topics:
- Management Interface Options, page 1-9
- Advantages of Using Network Assistant and Clustering Switches, page 1-10

Management Interface Options

You can configure and monitor individual switches and switch clusters by using these interfaces:
- An embedded device manager—The device manager is a GUI that is integrated in the software image. You use it to configure and monitor a single switch through a web browser. For more information about the device manager, see the switch online help.
- Network Assistant—Network Assistant is a GUI that can be downloaded from Cisco.com. You use it to manage a single switch or a cluster of switches. For more information about Network Assistant, see the Getting Started with Cisco Network Assistant, available on Cisco.com.
- CLI—The switch Cisco IOS software supports desktop-switching features. You can access the CLI either by connecting your management station directly to the switch console port or by using Telnet or SSH from a remote management station.
  For more information about the CLI, see Chapter 2, “Using the Command-Line Interface.”
- IE2100—Cisco Intelligence Engine 2100 Series Configuration Registrar is a network management device that works with embedded CNS Agents in the switch software. You can automate initial configurations and configuration updates by generating switch-specific configuration changes, sending them to the switch, executing the configuration change, and logging the results.
  For more information about IE2100, see Chapter 5, “Configuring Cisco IOS CNS Agents.”

- Support for configuring the interleave delay feature
- Support for DC-input power and compliance with the VDSL 997 band plan on Catalyst 2950ST-24 LRE 997 switches
- Upstream power back-off mechanism for normalization of the upstream receive power levels by requiring the CPE devices on shorter lines to transmit at a lower power level than the CPEs on longer lines
- Support for sending LRE debugging messages to the LRE message logging process and to the system message logging process
SNMP—SNMP provides means to monitor and control the switch and switch cluster members. You can manage switch configuration settings, performance, and security and collect statistics by using SNMP management applications such as CiscoWorks2000 LAN Management Suite (LMS) and HP OpenView.

You can manage the switch from an SNMP-compatible management station that is running platforms such as HP OpenView or SunNet Manager. The switch supports a comprehensive set of MIB extensions and four RMON groups.

For more information about using SNMP, see the Chapter 27, “Configuring SNMP.”

Advantages of Using Network Assistant and Clustering Switches

Using Network Assistant and switch clusters can simplify and minimize your configuration and monitoring tasks. You can use Cisco switch clustering technology to manage up to 16 interconnected and supported Catalyst switches through one IP address as if they were a single entity. This can conserve IP addresses if you have a limited number of them. Network Assistant is the easiest interface to use and makes switch and switch cluster management accessible to authorized users from any PC on your network.

By using switch clusters and Network Assistant, you can:

- Manage and monitor interconnected Catalyst switches (see the release notes for a list of supported switches), regardless of their geographic proximity and interconnection media, including Ethernet, Fast Ethernet, Fast EtherChannel, Cisco GigaStack GBIC, Gigabit Ethernet, and Gigabit EtherChannel connections.
- Accomplish multiple configuration tasks from a single Network Assistant window without needing to remember CLI commands to accomplish specific tasks.
- Apply actions from Network Assistant to multiple ports and multiple switches at the same time to avoid re-entering the same commands for each individual port or switch. Here are some examples of globally setting and managing multiple ports and switches:
  - Port configuration such as speed and duplex settings
  - Port and console port security settings
  - NTP, STP, VLAN, and quality of service (QoS) configurations
  - Inventory and statistic reporting and link and switch-level monitoring and troubleshooting
  - Group software upgrades
- View a topology of interconnected devices to identify existing switch clusters and eligible switches that can join a cluster. You can also use the topology to quickly identify link information between switches.
- Monitor real-time status of a switch or multiple switches from the LEDs on the front-panel images. The system, redundant power system (RPS), and port LED colors on the images are similar to those on the physical LEDs.
- Use an interactive mode that takes you step-by-step through configuring complex features such as VLANs, ACLs, and QoS.
- Use a wizard that prompts you to provide the minimum required information to configure complex features such as QoS priorities for video traffic, priority levels for data applications, and security.

For more information about Network Assistant and clustering, see the Getting Started with Cisco Network Assistant, available on Cisco.com.
Network Configuration Examples

This section provides network configuration concepts and includes examples of using the switch to create dedicated network segments and interconnecting the segments through Fast Ethernet and Gigabit Ethernet connections.

- “Design Concepts for Using the Switch” section on page 1-11
- “Small to Medium-Sized Network Configuration” section on page 1-14
- “Collapsed Backbone and Switch Cluster Configuration” section on page 1-15
- “Hotel Network Configuration” section on page 1-16
- “Service-Provider Central-Office Configuration” section on page 1-18
- “Large Campus Configuration” section on page 1-20
- “Multidwelling Network Using Catalyst 2950 Switches” section on page 1-21
- “Long-Distance, High-Bandwidth Transport Configuration” section on page 1-23

Design Concepts for Using the Switch

As your network users compete for network bandwidth, it takes longer to send and receive data. When you configure your network, consider the bandwidth required by your network users and the relative priority of the network applications they use.

Table 1-3 describes what can cause network performance to degrade and how you can configure your network to increase the bandwidth available to your network users.

<table>
<thead>
<tr>
<th>Network Demands</th>
<th>Suggested Design Methods</th>
</tr>
</thead>
</table>
| Too many users on a single network segment and a growing number of users accessing the Internet | • Create smaller network segments so that fewer users share the bandwidth, and use VLANs and IP subnets to place the network resources in the same logical network as the users who access those resources most.  
  • Use full-duplex operation between the switch and its connected workstations. |
| Increased power of new PCs, workstations, and servers                           | • Connect global resources—such as servers and routers to which network users require equal access—directly to the Fast Ethernet or Gigabit Ethernet switch ports so that they have their own Fast Ethernet or Gigabit Ethernet segment.  
  • Use the Fast EtherChannel or Gigabit EtherChannel feature between the switch and its connected servers and routers. |
| High demand from networked applications (such as e-mail with large attached files) and from bandwidth-intensive applications (such as multimedia) |                                                                                          |

Bandwidth alone is not the only consideration when designing your network. As your network traffic profiles evolve, consider providing network services that can support applications such as voice and data integration and security.

Table 1-4 describes some network demands and how you can meet those demands.
Network Configuration Examples

Figure 1-1 shows configuration examples of using the Catalyst switches to create these networks:

- **Cost-effective wiring closet**—A cost-effective way to connect many users to the wiring closet is to connect up to nine Catalyst 2900 XL, Catalyst 2950, Catalyst 3500 XL, and Catalyst 3550 switches through GigaStack GBIC connections. When you use a stack of Catalyst 2950G-48 switches, you can connect up to 432 users. To preserve switch connectivity if one switch in the stack fails, connect the bottom switch to the top switch to create a GigaStack loopback, and enable cross-stack UplinkFast on the cross-stack Gigabit uplinks.

  You can create backup paths by using Fast Ethernet, Gigabit, Fast EtherChannel, or Gigabit EtherChannel links. Using Gigabit modules on two of the switches, you can have redundant uplink connections to a Gigabit backbone switch such as the Catalyst 3550-12G switch. If one of the redundant connections fails, the other can serve as a backup path. You can configure the stack members and the Catalyst 3550-12G switch as a switch cluster to manage them through a single IP address.

- **High-performance workgroup**—For users who require high-speed access to network resources, use Gigabit modules to connect the switches directly to a backbone switch in a star configuration. Each switch in this configuration provides users with a dedicated 1-Gbps connection to network resources in the backbone. Compare this with the switches in a GigaStack configuration, where the 1-Gbps connection is shared among the switches. With the high speed uplink to the distribution server, the user can efficiently obtain and store data from servers. Using these Gigabit Ethernet modules also provides flexibility in media and distance options:

  - 1000BASE-T GBIC: copper connections of up to 328 feet (100 meters)
  - 1000BASE-SX GBIC: fiber connections of up to 1804 feet (550 meters)
  - 1000BASE-LX/LH GBIC: fiber connections of up to 32,808 feet (10 kilometers)
  - 1000BASE-ZX GBIC: fiber connections of up to 328,084 feet (100 kilometers)

</tbody>
</table>
– GigaStack GBIC module for creating a 1-Gbps stack configuration of up to nine supported switches. The GigaStack GBIC supports one full-duplex link (in a point-to-point configuration) or up to nine half-duplex links (in a stack configuration) to other Gigabit Ethernet devices. Using the required Cisco proprietary signaling and cabling, the GigaStack GBIC-to-GigaStack GBIC connection cannot exceed 3 feet (1 meter).

– SFP modules: fiber and copper connections of up to 32,808 feet (10 kilometers) (supported only on the Catalyst 2950 LRE switches)

• Redundant Gigabit backbone—Using HSRP, you can create backup paths between Catalyst 3550-12T-L3 switches. To enhance network reliability and load balancing for different VLANs and subnets, you can connect the Catalyst 2950 switches, again in a star configuration, to two backbone switches. If one of the backbone switches fails, the second backbone switch preserves connectivity between the switches and network resources.

Figure 1-1  Example Configurations

Cost-Effective Wiring Closet

Catalyst 2950 switch

Catalyst 2900 XL, Catalyst 2950, Catalyst 3500 XL, and Catalyst 3550 GigaStack cluster

High-Performance Workgroup

Catalyst 3550-12T or Catalyst 3550-12G switch

Gigabit server

Catalyst 2900 XL, Catalyst 2950, Catalyst 2955, Catalyst 3500 XL, and Catalyst 3550 cluster

Redundant Gigabit Backbone

Catalyst 3550-12T or Catalyst 3550-12G switch

1-Gbps HSRP

Catalyst 2900 XL, Catalyst 2950, Catalyst 2955, Catalyst 3500 XL, and Catalyst 3550 cluster
Small to Medium-Sized Network Configuration

Figure 1-2 shows a configuration for a network that has up to 250 users. Users in this network require e-mail, file-sharing, database, and Internet access.

You optimize network performance by placing workstations on the same logical segment as the servers they access most often. This divides the network into smaller segments (or workgroups) and reduces the amount of traffic that travels over a network backbone, thereby increasing the bandwidth available to each user and improving server response time.

Figure 1-2  Small to Medium-Sized Network Configuration

A network backbone is a high-bandwidth connection (such as Fast Ethernet or Gigabit Ethernet) that interconnects segments and network resources. It is required if numerous segments require access to the servers. The Catalyst 2900 XL, Catalyst 2950, Catalyst 3500 XL, and Catalyst 3550 switches in this network are connected through a GigaStack GBIC on each switch to form a 1-Gbps network backbone. This GigaStack can also be configured as a switch cluster, with primary and secondary command switches for redundant cluster management.

Workstations are connected directly to the 10/100 switch ports for their own 10- or 100-Mbps access to network resources (such as web and mail servers). When a workstation is configured for full-duplex operation, it receives up to 200 Mbps of dedicated bandwidth from the switch.
Chapter 1      Overview

Network Configuration Examples

Servers are connected to the GBIC module ports on the switches, allowing 1-Gbps throughput to users when needed. When the switch and server ports are configured for full-duplex operation, the links provide 2 Gbps of bandwidth. For networks that do not require Gigabit performance from a server, connect the server to a Fast Ethernet or Fast EtherChannel switch port.

Connecting a router to a Fast Ethernet switch port provides multiple, simultaneous access to the Internet through one line.

**Collapsed Backbone and Switch Cluster Configuration**

Figure 1-3 shows a configuration for a network of approximately 500 employees. This network uses a collapsed backbone and switch clusters. A collapsed backbone has high-bandwidth uplinks from all segments and subnetworks to a single device, such as a Gigabit switch, that serves as a single point for monitoring and controlling the network. You can use a Catalyst 3550-12T-L3 switch, as shown, or a Catalyst 3508G XL switch to create a Gigabit backbone. A Catalyst 3550-12T-L3 backbone switch provides the benefits of inter-VLAN routing and allows the router to focus on WAN access.

The workgroups are created by clustering all the Catalyst switches except the Catalyst 4908G-L3 switch. Using Network Assistant and Cisco switch clustering technology, you can group the switches into multiple clusters, as shown, or into a single cluster. You can manage a cluster through the IP address of its active and standby command switches, regardless of the geographic location of the cluster members.

This network uses VLANs to segment the network logically into well-defined broadcast groups and for security management. Data and multimedia traffic are configured on the same VLAN. Voice traffic from the Cisco IP Phones are configured on separate voice VLAN IDs (VVIDs). You can have up to four VVIDs per wiring closet. If data, multimedia, and voice traffic are assigned to the same VLAN, only one VLAN can be configured per wiring closet. For any switch port connected to Cisco IP Phones, 802.1p or 802.1Q QoS gives forwarding priority to voice traffic over data traffic.

Grouping servers in a centralized location provides benefits such as security and easier maintenance. The Gigabit connections to a server farm provide the workgroups full access to the network resources (such as a call-processing server running Cisco CallManager software, a DHCP server, or an IP/TV multicast server).

Cisco IP Phones are connected—using standard straight-through, twisted-pair cable with RJ-45 connectors—to the 10/100 inline-power ports on the Catalyst 3550-24PWR switches and to the 10/100 ports on the Catalyst 2950 switches. These multiservice switch ports automatically detect any IP phones that are connected. Cisco CallManager controls call processing, routing, and IP phone features and configuration. Users with workstations running Cisco SoftPhone software can place, receive, and control calls from their PCs. Using Cisco IP Phones, Cisco CallManager software, and Cisco SoftPhone software integrates telephony and IP networks, and the IP network supports both voice and data.

Each 10/100 inline-power port on the Catalyst 3550-24PWR switches provides –48 VDC power to the Cisco IP Phone. The IP phone can receive redundant power when it is also connected to an AC power source. IP phones not connected to the Catalyst 3550-24PWR switches receive power from an AC power source.
Figure 1-3  Collapsed Backbone and Switch Cluster Configuration

Hotel Network Configuration

Figure 1-4 shows Catalyst 2950ST-8 LRE and 2950ST-24 LRE switches in a hotel network environment with approximately 200 rooms. This network includes a PBX switchboard, a router, and high-speed servers.

Connected to the telephone line in each hotel room is an LRE CPE device, such as a Cisco LRE CPE device. The LRE CPE device provides:

- Two RJ-11 ports, one for connecting to the telephone jack on the wall and one for connecting to a POTS telephone.
- One or more RJ-45 Ethernet ports for connecting to devices such as a customer’s laptop, the room IP phone, the television set-top box, or a room environmental control device. A Cisco 575 LRE CPE provides one Ethernet connection; a Cisco 585 LRE CPE provides four.

When connected to the CPE device, the Ethernet devices and room telephone share the same telephone line.
All telephones not directly connected to the hotel room CPE device require microfilters with a 300-ohm termination. Microfilters improve voice call quality when voice and data equipment are using the same telephone line. They also prevent nonfiltered telephone rings and nonfiltered telephone transitions (such as on-hook to off-hook) from interrupting the Ethernet connection.

Through a patch panel, the telephone line from each room connects to a nonhomologated POTS splitter, such as the Cisco LRE 48 POTS Splitter. The splitter routes data (high-frequency) and voice (low-frequency) traffic from the telephone line to a Catalyst 2950 LRE switch and digital private branch exchange (PBX). The PBX routes voice traffic to the PSTN.

If a PBX is not on-site, a homologated POTS splitter is required to connect directly to the PSTN.

Consult the regulations for connecting to the PSTN in your area.

If a connection to a phone network is not required at all, a splitter is not needed, and the switch can connect directly to the patch panel.

Cisco LRE products can share lines with analog telephones, Integrated Services Digital Network (ISDN) telephone network, and PBX switches that use the 0 to 700 kHz frequency range.

Data to and from the room devices (such as e-mail for the laptop and IP multicast traffic for the television) are transferred through the LRE link, which is established between the CPE RJ-11 wall port and the LRE port on an LRE switch. The upstream and downstream rates on the LRE link are controlled by a profile configured on each LRE port. If the LRE switch was connected to the PSTN through a homologated POTS splitter, all LRE ports would use an ANSI-compliant LRE profile named LRE-998-15-4.

The Catalyst 2950 LRE switches are cascaded through their 10/100/1000 switch ports. Each switch also has a 10/100/1000 connection to an aggregation switch, such as a Catalyst 3550-12G switch. The aggregation switch can connect to these devices:

- Accounting, billing, and provisioning servers
- A router that provides Internet access to the premises

You can manage the switches as a switch cluster and through Network Assistant. You can also manage and monitor the individual CPE devices from the LRE switches to which they are connected. The Catalyst 2950 LRE switch ports support the same software features as 10/100/1000 switch ports. For example, you can configure port-based VLANs on the LRE ports to provide individual port security and protected ports to further prevent unwanted broadcasts within the VLANs.
Service-Provider Central-Office Configuration

Figure 1-5 shows the Catalyst 2950ST-24 LRE 997 switches in a service-provider central-office network environment. The Catalyst 2950ST-24 LRE 997 switches have DC-input power supply and are compliant with the VDSL 997 band plan. The Catalyst 2950 LRE switches are located in a central office and are connected to the Cisco 576 LRE 997 CPE devices located in different buildings. The switches also connect to a Cisco 7500 router.

Figure 1-5 shows the Catalyst 2950ST-24 LRE 997 switches in a service-provider central-office network environment.
You can use a POTS splitter to connect the switches to the CPE devices. The splitter routes data (high-frequency) to a Catalyst 2950 LRE switch and voice (low-frequency) traffic from the telephone line to a PSTN.

Connected to the telephone line in each office is an Cisco 576 LRE 997 CPE device. The LRE CPE device provides:

- Two RJ-11 ports, one for connecting to the telephone jack on the wall and one for connecting to a POTS telephone.
- One RJ-45 Ethernet port for connecting to devices such as a customer’s laptop, the office’s IP phone, the television set-top box, or a office environmental control device. A Cisco 576 LRE 997 provides one Ethernet connection.

When connected to the CPE device, the Ethernet devices and office telephone share the same telephone line.

**Note**

All telephones not directly connected to the office CPE device require microfilters with a 300-ohm termination. Microfilters improve voice call quality when voice and data equipment are using the same telephone line. They also prevent nonfiltered telephone rings and nonfiltered telephone transitions (such as on-hook to off-hook) from interrupting the Ethernet connection.

**Note**

Cisco LRE products can share lines with analog telephones and Integrated Services Digital Network (ISDN) telephone network that use the 0 to 120 kHz frequency range.

Data to and from the office devices (such as e-mail for the laptop and IP multicast traffic for the television) are transferred through the LRE link, which is established between the CPE RJ-11 wall port and the LRE port on an LRE switch. The upstream and downstream rates on the LRE link are controlled by a profile configured on each LRE port.

The Catalyst 2950 LRE switches are cascaded through their 10/100/1000 switch ports. Each switch also has a 10/100/1000 connection to an aggregation switch, such as a Catalyst 3550-12G switch or Cisco 7600 router.

You can manage the switches as a switch cluster and through Network Assistant. You can also manage and monitor the individual CPE devices from the LRE switches to which they are connected. The Catalyst 2950 LRE switch ports support the same software features as 10/100/1000 switch ports. For example, you can configure port-based VLANs on the LRE ports to provide individual port security and protected ports to further prevent unwanted broadcasts within the VLANs.
Large Campus Configuration

Figure 1-6 shows a configuration for a network of more than 1000 users. Because it can aggregate up to 130 Gigabit connections, a Catalyst 6500 multilayer switch is used as the backbone switch.

You can use the workgroup configurations shown in previous examples to create workgroups with Gigabit uplinks to the Catalyst 6500 switch. For example, you can use switch clusters that have a mix of Catalyst 2950 and Catalyst 2955 switches.

The Catalyst 6500 switch provides the workgroups with Gigabit access to core resources:

- Cisco 7000 series router for access to the WAN and the Internet.
- Server farm that includes a call-processing server running Cisco CallManager software. Cisco CallManager controls call processing, routing, and IP phone features and configuration.
- Cisco Access gateway (such as Cisco Access Digital Trunk Gateway or Cisco Access Analog Trunk Gateway) that connects the IP network to the Public Switched Telephone Network (PSTN) or to users in an IP telephony network.
A growing segment of residential and commercial customers are requiring high-speed access to Ethernet metropolitan-area networks (MANs). Figure 1-7 shows a configuration for a Gigabit Ethernet MAN ring using Catalyst 3550 multilayer switches as aggregation switches in the mini-point-of-presence (POP) location. These switches are connected through 1000BASE-X GBIC ports.

The resident switches can be Catalyst 2950 switches, providing customers with high-speed connections to the MAN. Catalyst 2900 LRE XL or 2950 LRE Layer 2-only switches also can be used as residential switches for customers requiring connectivity through existing telephone lines. The Catalyst LRE switches can then connect to another residential switch or to an aggregation switch. For more information about these switches, see the Catalyst 2950 Desktop Switch Hardware Installation Guide.
All ports on the residential Catalyst 2950 and 2955 switches (and Catalyst LRE switches if they are included) are configured as 802.1Q trunks with protected port and STP root guard features enabled. The protected port feature provides security and isolation between ports on the switch, ensuring that subscribers cannot view packets destined for other subscribers. STP root guard prevents unauthorized devices from becoming the STP root switch. All ports have IGMP snooping or CGMP enabled for multicast traffic management. ACLs on the uplink ports to the aggregating Catalyst 3550 multilayer switches provide security and bandwidth management.

The aggregating switches and routers provide services such as those described in the previous examples, “Small to Medium-Sized Network Configuration” and “Large Campus Configuration.”
Long-Distance, High-Bandwidth Transport Configuration

To use the feature described in this section, you must have the EI installed on your switch.

Figure 1-8 shows a configuration for transporting 8 Gigabits of data over a single fiber-optic cable. The Catalyst switches have Coarse Wave Division Multiplexer (CWDM) fiber-optic GBIC modules installed. Depending on the CWDM GBIC module, data is sent at wavelengths from 1470 nm to 1610 nm. The higher the wavelength, the farther the transmission can travel. A common wavelength used for long-distance transmissions is 1550 nm.

The CWDM GBIC modules connect to CWDM optical add/drop multiplexer (OADM) modules over distances of up to 393,701 feet (74.5 miles or 120 km). The CWDM OADM modules combine (or multiplex) the different CWDM wavelengths, allowing them to travel simultaneously on the same fiber-optic cable. The CWDM OADM modules on the receiving end separate (or demultiplex) the different wavelengths.

For more information about the CWDM GBIC modules and CWDM OADM modules, see the Cisco CWDM GBIC and CWDM SFP Installation Note.

**Figure 1-8** Long-Distance, High-Bandwidth Transport Configuration
Where to Go Next

Before configuring the switch, review these sections for start-up information:

- Chapter 2, “Using the Command-Line Interface”
- Chapter 4, “Assigning the Switch IP Address and Default Gateway”
- Chapter 5, “Configuring Cisco IOS CNS Agents”
CHAPTER 2

Using the Command-Line Interface

This chapter describes the Cisco IOS command-line interface (CLI) that you can use to configure your Catalyst 2950 and Catalyst 2955. It contains these sections:

- Cisco IOS Command Modes, page 2-1
- Getting Help, page 2-3
- Abbreviating Commands, page 2-4
- Using no and default Forms of Commands, page 2-4
- Understanding CLI Messages, page 2-5
- Using Command History, page 2-5
- Using Editing Features, page 2-6
- Searching and Filtering Output of show and more Commands, page 2-9
- Accessing the CLI, page 2-9

Cisco IOS Command Modes

The user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

When you start a session on the switch, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as show commands, which show the current configuration status, and clear commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

For information on accessing the CLI through the switch port or through a Telnet session, see the hardware installation guide.
Table 2-1 describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode. The examples in the table use the host name Switch.

**Table 2-1 Command Mode Summary**

<table>
<thead>
<tr>
<th>Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
<th>About This Mode</th>

</tr>
</tbody>
</table>
Getting Help

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command, as shown in Table 2-2.

Table 2-2  Help Summary

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>help</td>
<td>Obtain a brief description of the help system in any command mode.</td>
</tr>
<tr>
<td>abbreviated-command-entry?</td>
<td>Obtain a list of commands that begin with a particular character string. For example: Switch# di? dir disable disconnect</td>
</tr>
<tr>
<td>abbreviated-command-entry&lt;Tab&gt;</td>
<td>Complete a partial command name. For example: Switch# sh conf&lt;tab&gt; Switch# show configuration</td>
</tr>
<tr>
<td>?</td>
<td>List all commands available for a particular command mode. For example: Switch&gt; ?</td>
</tr>
</tbody>
</table>
Abbreviating Commands

You have to enter only enough characters for the switch to recognize the command as unique. This example shows how to enter the `show configuration` privileged EXEC command:

```
Switch# show conf
```

### Abbreviating Commands

#### Using no and default Forms of Commands

Almost every configuration command also has a `no` form. In general, use the `no` form to disable a feature or function or reverse the action of a command. For example, the `no shutdown` interface configuration command reverses the shutdown of an interface. Use the command without the keyword `no` to re-enable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a `default` form. The `default` form of a command returns the command setting to its default. Most commands are disabled by default, so the `default` form is the same as the `no` form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the `default` command enables the command and sets variables to their default values.

### Table 2-2 Help Summary (continued)

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>command ?</code></td>
<td>List the associated keywords for a command.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>Switch&gt; show ?</code></td>
</tr>
<tr>
<td><code>command keyword ?</code></td>
<td>List the associated arguments for a keyword.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# cdp holdtime ?</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;10-255&gt;</code> Length of time (in sec) that receiver must keep this packet</td>
</tr>
</tbody>
</table>
Understanding CLI Messages

Table 2-3 lists some error messages that you might encounter while using the CLI to configure your switch.

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Meaning</th>
<th>How to Get Help</th>
</tr>
</thead>
<tbody>
<tr>
<td>% Ambiguous command: &quot;show con&quot;</td>
<td>You did not enter enough characters for your switch to recognize the command.</td>
<td>Re-enter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.</td>
</tr>
<tr>
<td>% Incomplete command.</td>
<td>You did not enter all the keywords or values required by this command.</td>
<td>Re-enter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.</td>
</tr>
<tr>
<td>% Invalid input detected at <code>^</code> marker.</td>
<td>You entered the command incorrectly. The caret (^) marks the point of the error.</td>
<td>Enter a question mark (?) to display all the commands that are available in this command mode. The possible keywords that you can enter with the command appear.</td>
</tr>
</tbody>
</table>

Using Command History

The software provides a history or record of commands that you have entered. This feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize the command history feature to suit your needs as described in these sections:

- Changing the Command History Buffer Size, page 2-5
- Recalling Commands, page 2-6
- Disabling the Command History Feature, page 2-6

Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. Beginning in privileged EXEC mode, enter this command to change the number of command lines that the switch records during the current terminal session:

Switch# terminal history [size number-of-lines]

The range is from 0 to 256.

Beginning in line configuration mode, enter this command to configure the number of command lines the switch records for all sessions on a particular line:

Switch(config-line)# history [size number-of-lines]

The range is from 0 to 256.
Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in Table 2-4:

<table>
<thead>
<tr>
<th>Table 2-4 Recalling Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action</strong></td>
</tr>
<tr>
<td>Press Ctrl-P or the up arrow key.</td>
</tr>
<tr>
<td>Press Ctrl-N or the down arrow key.</td>
</tr>
<tr>
<td>show history</td>
</tr>
</tbody>
</table>

1. The arrow keys function only on ANSI-compatible terminals such as VT100s.

Disabling the Command History Feature

The command history feature is automatically enabled.

To disable the feature during the current terminal session, enter the terminal no history privileged EXEC command.

To disable command history for the line, enter the no history line configuration command.

Using Editing Features

This section describes the editing features that can help you manipulate the command line. It contains these sections:

- Enabling and Disabling Editing Features, page 2-6
- Editing Commands through Keystrokes, page 2-7
- Editing Command Lines that Wrap, page 2-8

Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it.

To re-enable the enhanced editing mode for the current terminal session, enter this command in privileged EXEC mode:

```
Switch# terminal editing
```

To reconfigure a specific line to have enhanced editing mode, enter this command in line configuration mode:

```
Switch(config-line)# editing
```
To globally disable enhanced editing mode, enter this command in line configuration mode:

```
Switch(config-line)# no editing
```

**Editing Commands through Keystrokes**

Table 2-5 shows the keystrokes that you need to edit command lines.

**Table 2-5 Editing Commands through Keystrokes**

<table>
<thead>
<tr>
<th>Capability</th>
<th>Keystroke(^1)</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move around the command line to make changes or corrections.</td>
<td>Press Ctrl-B, or press the left arrow key.</td>
<td>Move the cursor back one character.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-F, or press the right arrow key.</td>
<td>Move the cursor forward one character.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-A.</td>
<td>Move the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-E.</td>
<td>Move the cursor to the end of the command line.</td>
</tr>
<tr>
<td></td>
<td>Press Esc B.</td>
<td>Move the cursor back one word.</td>
</tr>
<tr>
<td></td>
<td>Press Esc F.</td>
<td>Move the cursor forward one word.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-T.</td>
<td>Transpose the character to the left of the cursor with the character located at the cursor.</td>
</tr>
<tr>
<td>Recall commands from the buffer and paste them in the command line. The switch provides a buffer with the last ten items that you deleted.</td>
<td>Press Ctrl-Y.</td>
<td>Recall the most recent entry in the buffer.</td>
</tr>
<tr>
<td></td>
<td>Press Esc Y.</td>
<td>Recall the next buffer entry. The buffer contains only the last 10 items that you have deleted or cut. If you press Esc Y more than ten times, you cycle to the first buffer entry.</td>
</tr>
<tr>
<td>Delete entries if you make a mistake or change your mind.</td>
<td>Press the <strong>Delete</strong> or <strong>Backspace</strong> key.</td>
<td>Erase the character to the left of the cursor.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-D.</td>
<td>Delete the character at the cursor.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-K.</td>
<td>Delete all characters from the cursor to the end of the command line.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-U or Ctrl-X.</td>
<td>Delete all characters from the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-W.</td>
<td>Delete the word to the left of the cursor.</td>
</tr>
<tr>
<td></td>
<td>Press Esc D.</td>
<td>Delete from the cursor to the end of the word.</td>
</tr>
<tr>
<td>Capitalize or lowercase words or capitalize a set of letters.</td>
<td>Press Esc C.</td>
<td>Capitalize at the cursor.</td>
</tr>
<tr>
<td></td>
<td>Press Esc L.</td>
<td>Change the word at the cursor to lowercase.</td>
</tr>
<tr>
<td></td>
<td>Press Esc U.</td>
<td>Capitalize letters from the cursor to the end of the word.</td>
</tr>
<tr>
<td>Designate a particular keystroke as an executable command, perhaps as a shortcut.</td>
<td>Press Ctrl-V or Esc Q.</td>
<td></td>
</tr>
</tbody>
</table>
Table 2-5  Editing Commands through Keystrokes (continued)

<table>
<thead>
<tr>
<th>Capability</th>
<th>Keystroke¹</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scroll down a line or screen on displays that are longer than the terminal screen can display.</td>
<td>Press the <strong>Return</strong> key.</td>
<td>Scroll down one line.</td>
</tr>
<tr>
<td>Note: The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including <strong>show</strong> command output. You can use the <strong>Return</strong> and <strong>Space</strong> bar keystrokes whenever you see the More prompt.</td>
<td>Press the <strong>Space</strong> bar.</td>
<td>Scroll down one screen.</td>
</tr>
<tr>
<td>Redisplay the current command line if the switch suddenly sends a message to your screen.</td>
<td>Press <strong>Ctrl-L</strong> or <strong>Ctrl-R</strong>.</td>
<td>Redisplay the current command line.</td>
</tr>
</tbody>
</table>

¹  The arrow keys function only on ANSI-compatible terminals such as VT100s.

## Editing Command Lines that Wrap

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command.

To scroll back to the beginning of the command entry, press **Ctrl-B** or the left arrow key repeatedly. You can also press **Ctrl-A** to immediately move to the beginning of the line.

### Note

The arrow keys function only on ANSI-compatible terminals such as VT100s.

In this example, the **access-list** global configuration command entry extends beyond one line. When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign ($) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.

```
Switch(config)# access-list 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1
Switch(config)# $ 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.255.255.0 eq 45
Switch(config)# $t tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.255.255.0 eq 45
```

After you complete the entry, press **Ctrl-A** to check the complete syntax before pressing the **Return** key to execute the command. The dollar sign ($) appears at the end of the line to show that the line has been scrolled to the right:

```
Switch(config)# access-list 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1$
```

The software assumes you have a terminal screen that is 80 columns wide. If you have a width other than that, use the **terminal width** privileged EXEC command to set the width of your terminal.
Use line wrapping with the command history feature to recall and modify previous complex command entries. For information about recalling previous command entries, see the “Editing Commands through Keystrokes” section on page 2-7.

**Searching and Filtering Output of show and more Commands**

You can search and filter the output for **show** and **more** commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see.

To use this functionality, enter a **show** or **more** command followed by the **pipe** character (|), one of the keywords **begin**, **include**, or **exclude**, and an expression that you want to search for or filter out:

```
command | {begin | include | exclude} regular-expression
```

Expressions are case sensitive. For example, if you enter **| exclude output**, the lines that contain **output** are not displayed, but the lines that contain **Output** appear.

This example shows how to include in the output display only lines where the expression **protocol** appears:

```
Switch# show interfaces | include protocol
Vlan1 is up, line protocol is up
Vlan10 is up, line protocol is down
GigabitEthernet0/1 is up, line protocol is down
```

**Accessing the CLI**

Before you can access the CLI, you need to connect a terminal or PC to the switch port and power on the switch as described in the hardware installation guide that shipped with your switch. Then, to understand the boot process and the options available for assigning IP information, see Chapter 4, “Assigning the Switch IP Address and Default Gateway.”

If your switch is already configured, you can access the CLI through a local connection or through a remote Telnet session, but your switch must first be configured for this type of access. For more information, see the “Setting a Telnet Password for a Terminal Line” section on page 8-6.

You can establish a connection with the switch by either:

- Connecting the switch port to a management station or dial-up modem. For information about connecting to the port, see the switch hardware installation guide.
- Using any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.

For information about configuring the switch for Telnet access, see the “Setting a Telnet Password for a Terminal Line” section on page 8-6. The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.

For information about configuring the switch for SSH, see the “Configuring the Switch for Secure Shell” section on page 8-33. The switch supports up to five simultaneous secure SSH sessions.

After you connect through the port, or through a Telnet session, or through an SSH session, the user EXEC prompt appears on the management station.
Configuring Catalyst 2955 Switch Alarms

This section describes how to configure the different alarms for the Catalyst 2955 switch.

Note

The alarms described in this chapter are not available on the Catalyst 2950 switch.

For complete syntax and usage information for the commands used in this chapter, see the switch command reference for this release.

This chapter consists of these sections:

- Understanding Catalyst 2955 Switch Alarms, page 3-1
- Configuring Catalyst 2955 Switch Alarms, page 3-4
- Displaying Catalyst 2955 Switch Alarms Status, page 3-11

Understanding Catalyst 2955 Switch Alarms

The Catalyst 2955 switch software monitors switch conditions on a per port or a switch basis. If the conditions present on the switch or port do not match the parameters set by the user, the switch software triggers an alarm or a system message. By default, the switch software sends the system messages to a system message logging facility, or a syslog facility. You can also configure the switch to send Simple Network Management Protocol (SNMP) traps to an SNMP server. You can configure the switch to trigger an external alarm device by using the two independent alarm relays (major or minor). For more information on how to configure the alarms, see the “Configuring Catalyst 2955 Switch Alarms” section on page 3-4.

This section includes information about these topics:

- Global Status Monitoring Alarms, page 3-2
- FCS Error Hysteresis Threshold, page 3-2
- Port Status Monitoring Alarms, page 3-3
- Triggering Alarm Options, page 3-3
Chapter 3  Configuring Catalyst 2955 Switch Alarms

Understanding Catalyst 2955 Switch Alarms

The Catalyst 2955 switch contains facilities for processing alarms related to temperature and power supply conditions. These are referred to as global or facility alarms. Table 3-1 lists the three global alarms and their descriptions and functions.

Table 3-1  Catalyst 2955 Global Status Monitoring Alarms

<table>
<thead>
<tr>
<th>Alarm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power Supply Alarm</td>
<td>The switch monitors dual DC power supply levels. If the system is configured to operate in a dual power mode, an alarm triggers if a power supply fails or is missing. The alarm is automatically cleared when both power supplies are present or working. You can configure the power supply alarm to be connected to the hardware relays. For more information, see the “Configuring the Power Supply Alarm” section on page 3-5.</td>
</tr>
</tbody>
</table>
| Temperature Alarms     | The switch contains a temperature sensor that monitors the environmental conditions inside the switch. The switch contains two alarms that are associated with temperature.  
  - The primary alarm is enabled automatically to trigger both at a low temperature (-20°C) and a high temperature (95°C) for the safe operation of the switch. It cannot be changed or disabled. By default, the primary temperature alarm is associated with the major relay.  
  - You can use the secondary temperature alarm to trigger an alarm when the system temperature is greater than the configured temperature threshold. The lower threshold is configurable within the range of 40°C to the maximum threshold, 95°C. The secondary alarm is disabled by default.  
  For more information, see the “Configuring the Switch Temperature Alarms” section on page 3-6. |

FCS Error Hysteresis Threshold

The Ethernet standard calls for a maximum bit error rate of $10^{-8}$. In the Catalyst 2955 switch, the bit error rate configurable range is from $10^{-6}$ to $10^{11}$. The bit error rate input to the switch is a positive exponent. If you want to configure the bit error rate of $10^{-9}$, then you enter the value 9 for the exponent. By default, the FCS bit error rate is $10^{-8}$.

You can set the FCS error hysteresis threshold to prevent the toggle of the alarm when the actual bit error rate fluctuates near the configured bit error rate. The hysteresis threshold is defined as the ratio between the alarm clear threshold to the alarm set threshold, expressed as a percentage value.

For example, if the FCS bit error rate alarm value is configured to $10^{-8}$, that value is the alarm set threshold. To set the alarm clear threshold at $5 \times 10^{-10}$, the hysteresis, value $h$, is determined as follows:

$h = \frac{\text{alarm clear threshold}}{\text{alarm set threshold}}$

$h = \frac{5 \times 10^{-10}}{10^{-8}} = 5 \times 10^{-2} = 0.05 = 5 \text{ percent}$

The FCS hysteresis threshold is applied to all ports on the Catalyst 2955 switch. The allowable range is from 1 to 10 percent. The default value is 10 percent. See the “Configuring the FCS Bit Error Rate Alarm” section on page 3-7 for more information.
Port Status Monitoring Alarms

The Catalyst 2955 switch can also monitor the status of the Ethernet ports and generate alarm messages based on the alarms listed in Table 3-2. To save user time and effort, the switch supports changing alarm configurations by using alarm profiles. You can create a number of profiles and assign one of these profiles to each Ethernet port.

Alarm profiles provide a mechanism for you to enable or disable alarm conditions for a port and associate the alarm conditions with one or both alarm relays. You can also use alarm profiles to set alarm conditions to send alarm traps to an SNMP server and system messages to a syslog server. The alarm profile defaultPort is applied to all interfaces in the factory configuration (by default).

Note: You can associate multiple alarms to one relay or one alarm to both relays.

Table 3-2 lists the port status monitoring alarms and their descriptions and functions. Each fault condition is assigned a severity level based on the Cisco IOS System Error Message Severity Level.

### Table 3-2 Catalyst 2955 Port Status Monitoring Alarms

<table>
<thead>
<tr>
<th>Alarm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link Fault alarm</td>
<td>The Catalyst 2955 switch generates a link fault alarm when there are problems with a port physical layer that cause unreliable data transmission. A typical link fault condition is loss of signal or clock. The link fault alarm is cleared automatically when the link fault condition is cleared. The severity for this alarm is <em>error condition</em>, level 3.</td>
</tr>
<tr>
<td>Port not Forwarding alarm</td>
<td>The switch generates a port not forwarding alarm when a port is not forwarding packets. This alarm is cleared automatically when the port begins to forward packets. The severity for this alarm is <em>warning</em>, level 4.</td>
</tr>
<tr>
<td>Port is not Operating alarm</td>
<td>The switch generates a port is not operating alarm when it finds that a port is in a failed state during the startup self-test. When triggered, the port is not operating alarm is only cleared when the switch is restarted and the port is found to be operational. The severity for this alarm is <em>error condition</em>, level 3.</td>
</tr>
<tr>
<td>FCS Bit Error Rate alarm</td>
<td>The switch generates an FCS Bit Error Rate alarm when the actual FCS Bit Error Rate is close to the configured FCS Bit Error Rate. You can set the FCS bit error rate by using the interface configuration CLI for each of the ports. See the “Configuring the FCS Bit Error Rate Alarm” section on page 3-7 for more information. The severity for this alarm is <em>error condition</em>, level 3.</td>
</tr>
</tbody>
</table>

### Triggering Alarm Options

The switch supports three methods for triggering alarms:

- **Configurable Relays**

  The switch is equipped with two independent alarm relays that can be triggered by alarms for global and port status conditions. The relays can be configured to send a fault signal to an external alarm device, such as a bell, light, or other signaling device. You can associate any alarm condition with either alarm relay or both relays. Each fault condition is assigned a severity level based on the Cisco IOS System Error Message Severity Level.

  See the “Configuring Catalyst 2955 Switch Alarms” section on page 3-4 for more information on configuring the relays.
SNMP Traps

SNMP is an application-layer protocol that provides a message format for communication between managers and agents. The SNMP system consists of an SNMP manager, an SNMP agent, and a management information base (MIB).

The `snmp-server enable traps` command can be modified in the Catalyst 2955 switch software to allow the user to send alarm traps to an SNMP server. You can use alarm profiles to set environmental or port status alarm conditions to send SNMP alarm traps. See the “Enabling SNMP Traps” section on page 3-11 for more information.

Syslog Messages

You can use alarm profiles to send system messages to a syslog server. See the “Configuring Catalyst 2955 Switch Alarms” section on page 3-4 for more information.

### Configuring Catalyst 2955 Switch Alarms

This section describes how to configure the Catalyst 2955 switch alarms:

- Default Catalyst 2955 Switch Alarm Configuration, page 3-4
- Configuring the Power Supply Alarm, page 3-5
- Configuring the Switch Temperature Alarms, page 3-6
- Configuring the FCS Bit Error Rate Alarm, page 3-7
- Configuring Alarm Profiles, page 3-9
- Enabling SNMP Traps, page 3-11

### Default Catalyst 2955 Switch Alarm Configuration

Table 3-3 shows the default Catalyst 2955 switch alarms configuration.

<table>
<thead>
<tr>
<th>Alarm</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>

Table 3-3 Default Catalyst 2955 Switch Alarm Configuration
Chapter 3      Configuring Catalyst 2955 Switch Alarms

Configuring the Power Supply Alarm

This section describes how to configure the power supply alarm on your switch. It contains this configuration information:

- Setting the Power Mode, page 3-5
- Setting the Power Supply Alarm Options, page 3-5

Setting the Power Mode

The Catalyst 2955 switch has two DC power inputs. By default, the system operates in the single power mode. You can use the `power-supply dual` global configuration command to set the dual mode operation. In dual-power mode, a second power supply gives power to the switch if the primary power supply fails.

Beginning in privileged EXEC mode, follow these steps to set the switch to dual power mode operation:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 power-supply dual</td>
<td>Set the system to dual mode operation.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show alarm settings</td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no power-supply dual` command to disable this alarm by setting the switch back to single power mode operation.

Setting the Power Supply Alarm Options

Use the `alarm facility power-supply` global configuration command to associate the power supply alarm to a relay. You can also configure all alarms and traps associated with the power supply alarm to be sent to syslog and the SNMP server.

Beginning in privileged EXEC mode, follow these steps to associate the power supply alarm to a relay:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 alarm facility power-supply relay</td>
<td>Associate the power supply alarm to the major or minor relay.</td>
</tr>
<tr>
<td>{major</td>
<td>minor}</td>
</tr>
<tr>
<td>Step 3 alarm facility power-supply notifies</td>
<td>Configure sending power supply alarm traps to an SNMP server.</td>
</tr>
<tr>
<td>Step 4 alarm facility power-supply syslog</td>
<td>Configure sending power supply alarm traps to a syslog server.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show alarm settings</td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `alarm facility power-supply relay` command to associate the power supply alarm to a relay. You can also configure all alarms and traps associated with the power supply alarm to be sent to syslog and the SNMP server.
To disable sending the alarm to a relay, to syslog, or to an SNMP server, use the **no alarm facility power-supply relay**, **no alarm facility power-supply notifies**, or **no alarm facility power-supply syslog** global configuration commands.

**Note**
Before you can use the **notifies** command to send alarm traps to an SNMP server, you must first set up the SNMP server by using the **snmp-server enable traps alarms** global configuration command. See the “Enabling SNMP Traps” section on page 3-11.

This example sets the power-supply monitoring alarm to the minor relay.

```
Switch(config) # alarm facility power-supply relay minor
```

### Configuring the Switch Temperature Alarms

The temperature thresholds for the primary temperature alarm cannot be changed, but you can change the association of the primary temperature alarm from the major relay to the minor relay. You can also set a lower maximum temperature threshold for the secondary temperature alarm and associate the alarm with either the major or minor relay.

This section describes how to configure the temperature alarms on your switch. It contains this configuration information:

- Setting a Secondary Temperature Threshold for the Switch, page 3-6
- Associating the Temperature Alarms to a Relay, page 3-7

### Setting a Secondary Temperature Threshold for the Switch

In global configuration mode, you can use the **alarm facility temperature secondary** command to set a lower temperature threshold for the secondary temperature monitoring alarm. You can also use the **alarm facility temperature secondary** command to associate the secondary temperature alarm to either the major or minor alarm relay.

Beginning in privileged EXEC mode, follow these steps to set a lower temperature threshold:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>alarm facility temperature secondary threshold</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show alarm settings</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the **no alarm facility temperature secondary threshold** global configuration command to disable the secondary temperature threshold alarm.

This example disables the secondary temperature alarm.

```
Switch(config) # no alarm facility temperature secondary 45
```
Configuring Catalyst 2955 Switch Alarms

Chapter 3

Associating the Temperature Alarms to a Relay

By default, the primary temperature alarm is associated to the major relay. You can use the `alarm facility temperature` command to associate the primary temperature alarm to the minor relay, to an SNMP trap, to a syslog message, or to associate the secondary temperature alarm to the major or minor relay, an SNMP trap, or a syslog message.

Beginning in privileged EXEC mode, follow these steps to associate the secondary temperature alarm to a relay:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>alarm facility temperature {primary</td>
<td>secondary} relay {major</td>
</tr>
<tr>
<td>alarm facility temperature {primary</td>
<td>secondary} notifies</td>
</tr>
<tr>
<td>alarm facility temperature {primary</td>
<td>secondary} syslog</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show alarm settings</td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Note**
Before you can use the `notifies` command to send alarm traps to an SNMP server, you must first set up the SNMP server by using the `snmp-server enable traps alarms` global configuration command. See the “Enabling SNMP Traps” section on page 3-11.

Use the `no alarm facility temperature secondary` to disable the secondary temperature alarm.

This example sets the secondary temperature alarm to the minor relay, with a lower high temperature threshold value of 45°C. All alarm and traps associated with this alarm will be sent to a syslog server and an SNMP server.

```
Switch(config) # alarm facility temperature secondary 45
Switch(config) # alarm facility temperature secondary relay minor
Switch(config) # alarm facility temperature secondary syslog
Switch(config) # alarm facility temperature secondary notifies
```

This example sets the first (primary) temperature alarm to the major relay. All alarms and traps associated with this alarm will be sent to a syslog server.

```
Switch(config) # alarm facility temperature primary syslog
Switch(config) # alarm facility temperature primary relay major
```

Configuring the FCS Bit Error Rate Alarm

This section describes how to configure the FCS bit error rate alarm on your switch:

- Setting the FCS Error Threshold, page 3-8
- Setting the FCS Error Hysteresis Threshold, page 3-8
Chapter 3  Configuring Catalyst 2955 Switch Alarms

Setting the FCS Error Threshold

The switch generates an FCS bit error rate alarm when the actual FCS bit error rate is close to the configured FCS bit error rate. Use the **fcs-threshold** interface configuration command to set the FCS error threshold.

Beginning in privileged EXEC mode, follow these steps to set the bit error rate value for a port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
</tbody>
</table>
| Step 3 | fcs-threshold value | Set the FCS error rate.  
For value, the range is 6 to 11 to set a maximum bit error rate of $10^{-6}$ to $10^{-11}$.  
By default, the FCS bit error rate is $10^{-8}$. |
| Step 4 | end | Return to privileged EXEC mode. |
| Step 5 | show fcs-threshold | Verify the setting. |
| Step 6 | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

Use the **no fcs-threshold** interface configuration command to return to the default FCS threshold value.

This example shows how to set the FCS bit error rate for a port to $10^{10}$

```
Switch# configure terminal
Switch(config)# interface fastethernet0/1
Switch(config-if)# fcs-threshold 10
```

Setting the FCS Error Hysteresis Threshold

The hysteresis setting prevents the toggle of an alarm when the actual bit error rate fluctuates near the configured bit error rate. Use the **alarm facility fcs-hysteresis** global configuration command to set the FCS error hysteresis threshold.

Note: The FCS hysteresis threshold is applied to all ports of a Catalyst 2955 switch.

Beginning in privileged EXEC mode, follow these steps to set the FCS error hysteresis threshold for a switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
</tbody>
</table>
| Step 2 | alarm facility fcs-hysteresis percentage | Set the hysteresis percentage for the switch.  
For percentage, the range is 1 to 10. The default value is 10 percent. |
| Step 3 | end | Return to privileged EXEC mode. |
| Step 4 | show running config | Verify the configuration. |
| Step 5 | copy running-config startup-config | (Optional) Save your entries in the configuration file. |
Use the `no alarm facility fcs-hysteresis` command to set the FCS error hysteresis threshold to its default value.

**Note**
The `show running config` command displays any FCS error hysteresis that is not the default value.

This example shows how to set the FCS error hysteresis at 5 percent.

```
Switch(config) # alarm facility fcs-hysteresis 5
```

### Configuring Alarm Profiles

This section describes how to configure alarm profiles on your switch. It contains this configuration information:

- Creating or Modifying an Alarm Profile, page 3-9
- Attaching an Alarm Profile to a Specific Port, page 3-10

#### Creating or Modifying an Alarm Profile

You can use the `alarm profile` global configuration command to create an alarm profile or to modify an existing profile. When you create a new alarm profile, none of the alarms are enabled.

**Note**
The only alarm enabled in the `defaultPort` profile is the Port is not Operating alarm.

Beginning in privileged EXEC mode, follow these steps to create an alarm profile:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 alarm profile name</td>
<td>Create the new profile or identify an existing profile, and then enter alarm profile configuration mode.</td>
</tr>
<tr>
<td>Step 3 alarm alarm-id</td>
<td>Add or modify alarm parameters for a specific alarm (see Table 3-4). The values are 1 to 4. You an enter more than one alarm ID separated by a space.</td>
</tr>
<tr>
<td>Step 4 notifies alarm-id</td>
<td>(Optional) Configure the alarm to send an SNMP trap to an SNMP server.</td>
</tr>
<tr>
<td>Step 5 relay-major alarm-id</td>
<td>(Optional) Configure the alarm to send an alarm trap to the major relay.</td>
</tr>
<tr>
<td>Step 5 relay-minor alarm-id</td>
<td>(Optional) Configure the alarm to send an alarm trap to the minor relay.</td>
</tr>
<tr>
<td>Step 6 syslog alarm-id</td>
<td>(Optional) Configure the alarm to send an alarm trap to a syslog server.</td>
</tr>
<tr>
<td>Step 7 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 8 show alarm profile name</td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>Step 9 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To delete an alarm profile, use the `no alarm profile name` global configuration command.
This example creates or modifies the alarm profile `fastE` for the fastEthernetPort with link-down (`alarmList` ID 3) and an FCS error rate of 30 percent (`alarmList` ID 4) alarms enabled. The link-down alarm is connected to the minor relay, and the FCS error rate alarm is connected to the major relay. These alarms also send notifications to an SNMP server and send system messages to a syslog server.

```
Switch(config)# alarm profile fastE
Switch(config-alarm-prof)# alarm 3 4
Switch(config-alarm-prof)# relay major 4
Switch(config-alarm-prof)# relay minor 3
Switch(config-alarm-prof)# notifies 3 4
Switch(config-alarm-prof)# syslog 3 4
```

**Note**

Before you can use the `notifies` command to send alarm traps to an SNMP server, you must first set up the SNMP server by using the `snmp-server enable traps alarms` global configuration command. See the “Enabling SNMP Traps” section on page 3-11.

Table 3-4 lists the `alarmList` IDs and their corresponding alarm definitions. For a description of these alarms, see the “Port Status Monitoring Alarms” section on page 3-3.

<table>
<thead>
<tr>
<th>AlarmList ID</th>
<th>Alarm Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Link fault</td>
</tr>
<tr>
<td>2</td>
<td>Port not forwarding</td>
</tr>
<tr>
<td>3</td>
<td>Port not operating</td>
</tr>
<tr>
<td>4</td>
<td>FCS error rate exceeds threshold</td>
</tr>
</tbody>
</table>

**Attaching an Alarm Profile to a Specific Port**

In interface configuration mode, you can use the `alarm-profile` command to attach an alarm profile to a specific port.

Beginning in privileged EXEC mode, follow these steps to attach an alarm profile to a port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>interface port interface</td>
<td>Enter the number of the switch port to be configured, and the switch enters interface configuration mode.</td>
</tr>
<tr>
<td>alarm-profile name</td>
<td>Attach the specified profile to the interface.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show alarm profile</td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To detach an alarm profile from a specific port, use the `no alarm-profile name` interface configuration command.

This example attaches an alarm profile named `fastE` to a port.

```
Switch(config)# interface fastethernet 0/2
Switch(config-if)# alarm profile fastE
```
This example detaches an alarm profile named \textit{fastE} from a port.

\begin{verbatim}
Switch(config)# interface FastEthernet 0/2
Switch(config-if)# no alarm profile fastE
\end{verbatim}

**Enabling SNMP Traps**

Use the \texttt{snmp-server enable traps alarms} global configuration command to enable the switch to send alarm traps.

\begin{attention}
Before using alarm profiles to set the switch to send SNMP alarm trap notifications to an SNMP server, you must first enable SNMP by using the \texttt{snmp-server enable traps alarms} global configuration command.
\end{attention}

Beginning in privileged EXEC mode, follow these steps to enable the switch to send alarm traps:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>snmp-server enable traps alarms</td>
<td>Enable the switch to send SNMP traps.</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>show alarm settings</td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Displaying Catalyst 2955 Switch Alarms Status**

To display the global and port alarm status, use one or more of the privileged EXEC commands in Table 3-5:

**Table 3-5** Commands for Displaying Global and Port Alarm Status

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show alarm description port</td>
<td>Displays an alarm number and its text description.</td>
</tr>
<tr>
<td>show alarm profile [name]</td>
<td>Displays all alarm profiles in the system or a specified profile.</td>
</tr>
<tr>
<td>show alarm settings settings</td>
<td>Displays all global alarm settings in the switch.</td>
</tr>
<tr>
<td>show env [all</td>
<td>power</td>
</tr>
<tr>
<td>show alarm status [critical</td>
<td>info</td>
</tr>
</tbody>
</table>
Assigning the Switch IP Address and Default Gateway

This chapter describes how to create the initial switch configuration (for example, assign the switch IP address and default gateway information) for the Catalyst 2950 or Catalyst 2955 switch by using a variety of automatic and manual methods. It also describes how to modify the switch startup configuration only on the Catalyst 2950 Long-Reach Ethernet (LRE) switches.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the Cisco IOS IP and IP Routing Command Reference, Release 12.1.

This chapter consists of these sections:

- Understanding the Boot Process, page 4-1
- Assigning Switch Information, page 4-2
- Checking and Saving the Running Configuration, page 4-12
- Modifying the Startup Configuration, page 4-13 (available only on the Catalyst 2950 LRE switch)
- Scheduling a Reload of the Software Image, page 4-17 (available only on the Catalyst 2950 LRE switch)

Understanding the Boot Process

To start your switch, you need to follow the procedures in the hardware installation guide about installing and powering on the switch, and setting up the initial configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth) of the switch.

The normal boot process involves the operation of the boot loader software, which performs these activities:

- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
- Performs power-on self-test (POST) for the CPU subsystem. It tests the CPU DRAM and the portion of the flash device that makes up the flash file system.
- Initializes the flash file system on the system board.
- Loads a default operating system software image into memory and boots the switch.
The boot loader provides access to the flash file system before the operating system is loaded. Normally, the boot loader is used only to load, uncompress, and launch the operating system. After the boot loader gives the operating system control of the CPU, the boot loader is not active until the next system reset or power on.

The boot loader also provides trap-door access into the system if the operating system has problems so serious that it cannot be used. The trap-door mechanism provides enough access to the system so that if it is necessary, you can format the flash file system, re-install the operating system software image by using the XMODEM Protocol, recover from a lost or forgotten password, and finally restart the operating system. For more information, see the “Recovering from a Software Failure” section on page 31-2, the “Recovering from Lost or Forgotten Passwords on Non-LRE Catalyst 2950 Switches” section on page 31-2, the “Recovering from Lost or Forgotten Passwords on Catalyst 2950 LRE Switches” section on page 31-4, and the “Recovering from Lost or Forgotten Passwords on Catalyst 2955 Switches” section on page 31-7.

Before you can assign switch information, make sure you have connected a PC or terminal to the console port, and configured the PC or terminal-emulation software baud rate and character format to match these of the switch console port:

- Baud rate default is 9600.
- Data bits default is 8.
- Stop bits default is 1.
- Parity settings default is none.

Note
If you are using Express Setup, do not connect any devices to the switch before starting Express Setup.

See your switch hardware installation guide for more information.

Note
The Catalyst 2955 switches do not support Express Setup.

Assigning Switch Information

You can assign IP information through the switch Express Setup program, through the command-line-interface (CLI)-based setup program, through a DHCP server, or manually by using the CLI. If you are an experienced user familiar with the switch configuration steps, manually configure the switch. Otherwise, use one of the setup programs.

Note
The Catalyst 2955 switches do not support Express Setup.
Non-LRE Catalyst 2950 switches running a release prior to Cisco IOS Release 12.1(14)EA1 and Catalyst 2950 LRE switches running a release prior to Cisco IOS Release 12.1(19)EA1 do not support Express Setup.

Use the switch Express Setup or CLI-based setup program if you want to be prompted for specific IP information. With these programs, you can also configure a default gateway, a host name, and a switch (enable secret) password. You also have the option of assigning a Telnet password (to provide security during remote management) and enabling Simple Network Management Protocol (SNMP). The
CLI-based setup program also allows you to configure your switch as a command or member switch of a cluster or as a standalone switch. For more information about the Express Setup and CLI-based setup programs, see the hardware installation guide for your switch.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.

**Note** If you are using DHCP, do not respond to any of the questions in the setup program until the switch receives the dynamically assigned IP address and reads the configuration file.

This section has this configuration information:
- Default Switch Information, page 4-3
- Understanding DHCP-Based Autoconfiguration, page 4-3
- Configuring DHCP-Based Autoconfiguration, page 4-5
- Understanding DHCP-Based Autoconfiguration, page 4-3
- Configuring DHCP-Based Autoconfiguration, page 4-5
- Understanding DHCP-Based Autoconfiguration with a Saved Configuration, page 4-10
- Configuring DHCP-Based Autoconfiguration with a saved configuration, page 4-11
- Manually Assigning IP Information, page 4-12

## Default Switch Information

Table 4-1 shows the default switch information.

<table>
<thead>
<tr>
<th>Feature</th>

## Understanding DHCP-Based Autoconfiguration

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and a mechanism for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The switch can act as both a DHCP client and a DHCP server.
Assigning the Switch IP Address and Default Gateway

Assigning Switch Information

Note

The DHCP server feature is only available on Catalyst 2955 switches.

During DHCP-based autoconfiguration, your switch (DHCP client) is automatically configured at startup with IP address information and a configuration file.

Note

The DHCP-base autoconfiguration only occurs when you place a switch with no configuration or a new switch on the network.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your switch. However, you need to configure the DHCP server for various lease options associated with IP addresses. If you are using DHCP to relay the configuration file location on the network, you might also need to configure a TFTP server and a Domain Name System (DNS) server.

The DHCP server for your switch can be on the same LAN or on a different LAN than the switch. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your switch and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your switch.

DHCP Client Request Process

When you boot your switch, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the switch.

DHCP autoconfiguration does not occur under these conditions:

• When a configuration file is present and the `service config` global configuration command is disabled on the switch.

• When a configuration file is present and the `service config` global configuration command is enabled on the switch. In this case, the switch broadcasts TFTP requests for the configuration file.

Figure 4-1 shows the sequence of messages that are exchanged between the DHCP client and the DHCP server.

**Figure 4-1  DHCP Client and Server Message Exchange**

The client, Switch A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.
In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the switch receives depends on how you configure the DHCP server. For more information, see the “DHCP Server Configuration Guidelines” section on page 4-5.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (a configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server. The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOFFER message (the DHCP server assigned the parameters to another client).

A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the switch accepts replies from a BOOTP server and configures itself, the switch broadcasts, instead of unicasts, TFTP requests to obtain the switch configuration file.

Configuring DHCP-Based Autoconfiguration

These sections describe how to configure DHCP-based autoconfiguration.

- DHCP Server Configuration Guidelines, page 4-5
- Configuring the TFTP Server, page 4-6
- Configuring the DNS, page 4-7
- Configuring the Relay Device, page 4-7
- Obtaining Configuration Files, page 4-8
- Example Configuration, page 4-9

If your DHCP server is a Cisco device, or if you are configuring the switch as a DHCP server, see the “IP Addressing and Services” section in the Cisco IOS IP and IP Routing Configuration Guide for Cisco IOS Release 12.1 for additional information about configuring DHCP.

DHCP Server Configuration Guidelines

Follow these guidelines if you are configuring a device as a DHCP server:

The switch can act as both the DHCP client and the DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your switch.

**Note**

The DHCP server feature is only available on Catalyst 2955 switches.

You should configure the DHCP server with reserved leases that are bound to each switch by the switch hardware address.
Chapter 4 Assigning the Switch IP Address and Default Gateway

Assigning Switch Information

If you want the switch to receive IP address information, you must configure the DHCP server with these lease options:

- IP address of the client (required)
- Subnet mask of the client (required)
- DNS server IP address (optional)
- Router IP address (default gateway address to be used by the switch) (required)

If you want the switch to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:

- TFTP server name (required)
- Boot filename (the name of the configuration file that the client needs) (recommended)
- Host name (optional)

Depending on the settings of the DHCP server, the switch can receive IP address information, the configuration file, or both.

If you do not configure the DHCP server with the lease options described previously, it replies to client requests with only those parameters that are configured. If the IP address and subnet mask are not in the reply, the switch is not configured. If the router IP address or TFTP server name are not found, the switch might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not affect autoconfiguration.

Configuring the TFTP Server

Based on the DHCP server configuration, the switch attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the switch with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the switch attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename, the TFTP server, or if the configuration file could not be downloaded, the switch attempts to download a configuration file by using various combinations of filenames and TFTP server addresses. The files include the specified configuration filename (if any) and these files: network-config, cisconet.cfg, hostname.config, or hostname.cfg, where hostname is the switch’s current hostname. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the switch to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include these files:

- The configuration file named in the DHCP reply (the actual switch configuration file).
- The network-config or the cisconet.cfg file (known as the default configuration files).
- The router-config or the ciscorr.cfg file (These files contain commands common to all switches. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server to be used is on a different LAN from the switch, or if it is to be accessed by the switch through the broadcast address (which occurs if the DHCP server response does not contain all the required information described previously), a relay must be configured to forward the TFTP packets to the TFTP server. For more information, see the “Configuring the Relay Device” section on page 4-7. The preferred solution is to configure the DHCP server with all the required information.
Configuring the DNS

The DHCP server uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the switch.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server from where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database.

The DNS server can be on the same or on a different LAN as the switch. If it is on a different LAN, the switch must be able to access it through a router.

Configuring the Relay Device

You must configure a relay device, also referred to as a relay agent, when a switch sends broadcast packets that require a response from a host on a different LAN. Examples of broadcast packets that the switch might send are DHCP, DNS, and in some cases, TFTP packets. You must configure this relay device to forward received broadcast packets on an interface to the destination host.

If the relay device is a Cisco router, enable IP routing (\texttt{ip routing} global configuration command), and configure helper addresses by using the \texttt{ip helper-address} interface configuration command.

For example, in Figure 4-2, configure the router interfaces as follows:

On interface 10.0.0.2:

\begin{verbatim}
router(config-if)# ip helper-address 20.0.0.2
router(config-if)# ip helper-address 20.0.0.3
router(config-if)# ip helper-address 20.0.0.4
\end{verbatim}

On interface 20.0.0.1

\begin{verbatim}
router(config-if)# ip helper-address 10.0.0.1
\end{verbatim}

\textbf{Figure 4-2} \hspace{1cm} \textbf{Relay Device Used in Autoconfiguration}

\begin{figure}[h]

\caption{Relay Device Used in Autoconfiguration}
\end{figure}
Assigning Switch Information

Chapter 4 Assigning the Switch IP Address and Default Gateway

Obtaining Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the switch obtains its configuration information in these ways:

- The IP address and the configuration filename is reserved for the switch and provided in the DHCP reply (one-file read method).

  The switch receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

- The IP address and the configuration filename is reserved for the switch, but the TFTP server address is not provided in the DHCP reply (one-file read method).

  The switch receives its IP address, subnet mask, and the configuration filename from the DHCP server. The switch sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

- Only the IP address is reserved for the switch and provided in the DHCP reply. The configuration filename is not provided (two-file read method).

  The switch receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the network-config or cisconet.cfg default configuration file. (If the network-config file cannot be read, the switch reads the cisconet.cfg file.)

  The default configuration file contains the host names-to-IP-address mapping for the switch. The switch fills its host table with the information in the file and obtains its host name. If the host name is not found in the file, the switch uses the host name in the DHCP reply. If the host name is not specified in the DHCP reply, the switch uses the default Switch as its host name.

  After obtaining its host name from the default configuration file or the DHCP reply, the switch reads the configuration file that has the same name as its host name (hostname-config or hostname.cfg, depending on whether network-config or cisconet.cfg was read earlier) from the TFTP server. If the cisconet.cfg file is read, the filename of the host is truncated to eight characters.

  If the switch cannot read the network-config, cisconet.cfg, or the hostname file, it reads the router-config file. If the switch cannot read the router-config file, it reads the ciscortr.cfg file.

  The switch broadcasts TFTP server requests if the TFTP server is not obtained from the DHCP replies, if all attempts to read the configuration file through unicast transmissions fail, or if the TFTP server name cannot be resolved to an IP address.
Example Configuration

Figure 4-3 shows a sample network for retrieving IP information by using DHCP-based autoconfiguration.

![Figure 4-3 DHCP-Based Autoconfiguration Network Example](image)

Table 4-2 shows the configuration of the reserved leases on the DHCP server.

DNS Server Configuration

The DNS server maps the TFTP server name `tftpserver` to IP address 10.0.0.3.

TFTP Server Configuration (on UNIX)

The TFTP server base directory is set to `/tftpserver/work/`. This directory contains the network-config file used in the two-file read method. This file contains the host name to be assigned to the switch based on its IP address. The base directory also contains a configuration file for each switch (`switcha-config`, `switchb-config`, and so forth) as shown in this display:

```
prompt> cd /tftpserver/work/
prompt> ls
network-config
switcha-config
```
Assigning Switch Information

switchb-config
switchc-config
switchd-config
prompt> cat network-config
ip host switch1 10.0.0.21
ip host switch2 10.0.0.22
ip host switch3 10.0.0.23
ip host switch4 10.0.0.24

DHCP Client Configuration

No configuration file is present on Switch A through Switch D.

Configuration Explanation

In Figure 4-3, Switch A reads its configuration file as follows:

- It obtains its IP address 10.0.0.21 from the DHCP server.
- If no configuration filename is given in the DHCP server reply, Switch A reads the network-config file from the base directory of the TFTP server.
- It adds the contents of the network-config file to its host table.
- It reads its host table by indexing its IP address 10.0.0.21 to its host name (switcha).
- It reads the configuration file that corresponds to its host name; for example, it reads switch1-config from the TFTP server.

Switches B through D retrieve their configuration files and IP addresses in the same way.

Understanding DHCP-Based Autoconfiguration with a Saved Configuration

DHCP-based autoconfiguration with a saved configuration works exactly the same as DHCP-based autoconfiguration except that you can now enable an autoconfiguration on a switch that already contains a basic configuration file in its memory.

To utilize DHCP-based autoconfiguration with a saved configuration, you will need to pre-configure a switch with a basic booting configuration and deploy the switch in your network. That pre-configuration should include the necessary Layer 3 interface for obtaining an IP address and the configuration file. The Layer 3 interface must have a specific DHCP scope configured on the DHCP server which includes option 150 TFTP server IP address and option 67 Configuration filename. After you install the switch into your network, if it is enabled, the auto-install feature will start. The downloaded configuration file is saved in the running configuration of the switch. The configuration file is not saved in NVRAM. When the switch is restarted the downloaded configuration is ignored and a fresh configuration is downloaded from the TFTP server.

Limitations and Restrictions

- The DHCP-based autoconfiguration with a saved configuration process is aborted if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.
- Unless you configure a time-out the DHCP-based autoconfiguration with a saved configuration feature will try indefinitely to download an IP address.
- The auto-install process is aborted if a configuration file cannot be downloaded or the configuration file is corrupted.
Chapter 4  Assigning the Switch IP Address and Default Gateway

Assigning Switch Information

Note

The configuration file that is downloaded from TFTP is merged with the switch’s existing configuration
in the running configuration and is not saved in the NVRAM unless the configuration write memory or

| copy running-configuration startup-configuration command is entered. Note that if the configuration
downloaded is saved in to the startup-configuration, the feature is not triggered during subsequent
system restarts.

Configuring DHCP-Based Autoconfiguration with a saved configuration

Beginning in privileged EXEC mode, follow these steps to configure DHCP-based autoconfiguration
with a saved configuration:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>boot host dhcp</td>
</tr>
</tbody>
</table>
| Step 3  | boot host retry timeout timeout-value | Optional) Set the amount of time the system tries to
download a configuration file. |
| Note    | If you do not set a timeout the system will indefinitely try to obtain an IP address from the
DHCP server. |
| Step 4  | banner config-save ^C warning-message ^C | (Optional) Create warning messages to be displayed
when you try to save the configuration file to NVRAM. |
| Step 5  | end | Return to privileged EXEC mode. |
| Step 6  | show boot | Verify the configuration. |

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with
a saved configuration:

Switch# configure terminal
Switch(conf)# boot host dhcp
Switch(conf)# boot host retry timeout 300
Switch(conf)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause
You to No longer Automatically Download Configuration Files at Reboot^C
Switch(conf)# vlan 99
Switch(config-vlan)# interface vlan 99
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch# show boot
BOOT path-list:
Config file: flash:/config.text
Private Config file: flash:/private-config.text
Enable Break: no
Manual Boot: no
HELPER path-list:
NVRAM/Config file
buffer size: 32768
Timeout for Config
Download: 300 seconds
Config Download
via DHCP: enabled (next boot: enabled)
Switch#
Checking and Saving the Running Configuration

You should only configure and enable the Layer 3 interface. Do not assign an IP address or DHCP-based autoconfiguration with a saved configuration will not work.

Manually Assigning IP Information

Beginning in privileged EXEC mode, follow these steps to manually assign IP information to VLANs:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: interface vlan vlan-id</td>
<td>Enter interface configuration mode, and enter the VLAN to which the IP information is assigned. The range is 1 to 4094 when the enhanced software image is installed and 1 to 1001 when the standard software image is installed.</td>
</tr>
<tr>
<td>Step 3: ip address ip-address subnet-mask</td>
<td>Enter the IP address and subnet mask.</td>
</tr>
<tr>
<td>Step 4: exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>Step 5: ip default-gateway ip-address</td>
<td>Enter the IP address of the next-hop router interface that is directly connected to the switch where a default gateway is being configured. The default gateway receives IP packets with unresolved destination IP addresses from the switch. Once the default gateway is configured, the switch has connectivity to the remote networks with which a host needs to communicate.</td>
</tr>
<tr>
<td>Note</td>
<td>When your switch is configured to route with IP, it does not need to have a default gateway set.</td>
</tr>
<tr>
<td>Step 6: end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7: show interfaces vlan vlan-id</td>
<td>Verify the configured IP address.</td>
</tr>
<tr>
<td>Step 8: show ip redirects</td>
<td>Verify the configured default gateway.</td>
</tr>
<tr>
<td>Step 9: copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the switch IP address, use the `no ip address` interface configuration command. If you are removing the address through a Telnet session, your connection to the switch will be lost. To remove the default gateway address, use the `no ip default-gateway` global configuration command.

For information on setting the switch system name, protecting access to privileged EXEC commands, and setting time and calendar services, see Chapter 7, “Administering the Switch.”

Checking and Saving the Running Configuration

You can check the configuration settings you entered or changes that you made by entering the `show running-config` privileged EXEC command: For information about the output of this command, see the Cisco IOS Configuration Fundamental Command Reference for Release 12.1.
To store the configuration or changes you have made to your startup configuration in flash memory, enter the `copy running-config startup-config` privileged EXEC command. This command saves the configuration settings that you made. If you fail to do this, your configuration will be lost the next time you reload the system. To display information stored in the NVRAM section of flash memory, use the `show startup-config` or `more startup-config` privileged EXEC command.

For more information about alternative locations from which to copy the configuration file on the Catalyst 2950 LRE switches, see Appendix B, “Working with the Cisco IOS File System, Configuration Files, and Software Images.”

## Modifying the Startup Configuration

This section describes how to modify the switch startup configuration only on a Catalyst 2950 LRE switch. It contains this configuration information:

- Default Boot Configuration, page 4-13
- Automatically Downloading a Configuration File, page 4-13
- Specifying the Filename to Read and Write the System Configuration, page 4-14
- Booting Manually, page 4-14
- Booting a Specific Software Image, page 4-15
- Controlling Environment Variables, page 4-16

### Default Boot Configuration

Table 4-3 shows the default boot configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
</table>
| Operating system software image | The switch attempts to automatically boot the system using information in the BOOT environment variable. If the variable is not set, the switch attempts to load and execute the first executable image it can by performing a recursive, depth-first search throughout the flash file system.  
The software image is stored in a directory that has the same name as the image file (excluding the .bin extension).  
In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory. |
| Configuration file           | Configured switches use the `config.text` file stored on the system board in flash memory.  
A new switch has no configuration file. |

### Automatically Downloading a Configuration File

You can automatically download a configuration file to your switch by using the DHCP-based autoconfiguration feature. For more information, see the “Understanding DHCP-Based Autoconfiguration” section on page 4-3.
Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the file `config.text` to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename that is loaded during the next boot cycle.

Beginning in privileged EXEC mode, follow these steps to specify a different configuration filename:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 boot config-file flash:</td>
<td>Specify the configuration file to load during the next boot cycle.</td>
</tr>
<tr>
<td>file-url</td>
<td>For <code>file-url</code>, specify the path (directory) and the configuration filename.</td>
</tr>
<tr>
<td></td>
<td>Filenames and directory names are case sensitive.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show boot</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td></td>
<td>The <code>boot config-file</code> global configuration command changes the setting of the CONFIG_FILE environment variable.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default setting, use the `no boot config-file` global configuration command.

Booting Manually

By default, the switch automatically boots; however, you can configure it to manually boot.

Beginning in privileged EXEC mode, follow these steps to configure the switch to manually boot during the next boot cycle:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 boot manual</td>
<td>Enable the switch to manually boot during the next boot cycle.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Chapter 4      Assigning the Switch IP Address and Default Gateway

Modifying the Startup Configuration

To disable manual booting, use the **no boot manual** global configuration command.

### Booting a Specific Software Image

By default, the switch attempts to automatically boot the system using information in the BOOT environment variable. If this variable is not set, the switch attempts to load and execute the first executable image it can by performing a recursive, depth-first search throughout the flash file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory. However, you can specify a specific image to boot.

Beginning in privileged EXEC mode, follow these steps to configure the switch to boot a specific image during the next boot cycle:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>boot system <em>filesystem</em>:<em>file-url</em></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show boot</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default setting, use the **no boot system** global configuration command.
Controlling Environment Variables

You enter the boot loader mode only through a switch console connection configured for 9600 bps. Unplug the switch power cord, and press the switch Mode button while reconnecting the power cord. Release the Mode button a second or two after the LED above port 1X turns off. Then the boot loader switch: prompt appears.

The switch boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader, or any other software running on the system, behaves. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in the flash file system in various files as shown in Table 4-4.

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Location (file system:filename)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAUD, ENABLE_BREAK, CONFIG_BUFSIZE,</td>
<td>flash:env_vars</td>
</tr>
<tr>
<td>CONFIG_FILE, MANUAL_BOOT, PS1</td>
<td></td>
</tr>
<tr>
<td>BOOT, BOOTHLP, HELPER, HELPER_CONFIG_FILE</td>
<td>flash:system_env_vars</td>
</tr>
</tbody>
</table>

Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not listed in this file; it has a value if it is listed in the file even if the value is a null string. A variable that is set to a null string (for example, “” ) is a variable with a value. Many environment variables are predefined and have default values.

Environment variables store two kinds of data:

- Data that controls code, which does not read the Cisco IOS configuration file. For example, the name of a boot loader helper file, which extends or patches the functionality of the boot loader can be stored as an environment variable.
- Data that controls code, which is responsible for reading the Cisco IOS configuration file. For example, the name of the Cisco IOS configuration file can be stored as an environment variable.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. It is not necessary to alter the setting of the environment variables.

Note
For complete syntax and usage information for the boot loader commands and environment variables, see the command reference for this release.
Table 4-5 describes the function of the most common environment variables.

Table 4-5  Environment Variables

|                   |                                             | memory. The buffer holds a copy of the |
|                   |                                             | configuration file in memory. This     |
|                   |                                             | command changes the setting of the     |
|                   |                                             | CONFIG_BUFSIZE environment variable.    |
|                   |                                             | You must reload the switch by using the|
|                   |                                             | reload privileged EXEC command for this |
|                   |                                             | command to take effect.                 |

Scheduling a Reload of the Software Image

You can schedule a reload of the software image to occur only an LRE switch at a later time (for example, late at night or during the weekend when the switch is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all switches in the network).
Scheduling a Reload of the Software Image

A scheduled reload must take place within approximately 24 days.

### Configuring a Scheduled Reload

To configure your switch to reload the software image at a later time, use one of these commands in privileged EXEC mode:

- **reload in [hh:mm [text]]**
  
  This command schedules a reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 days. You can specify the reason for the reload in a string up to 255 characters in length.

- **reload at hh:mm [month day] [day month] [text]**
  
  This command schedules a reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

  **Note** Use the *at* keyword only if the switch system clock has been set (through Network Time Protocol (NTP), the hardware calendar, or manually). The time is relative to the configured time zone on the switch. To schedule reloads across several switches to occur simultaneously, the time on each switch must be synchronized with NTP.

The `reload` command halts the system. If the system is not set to manually boot, it reboots itself. Use the `reload` command after you save the switch configuration information to the startup configuration (`copy running-config startup-config`).

If your switch is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the switch from entering the boot loader mode and thereby taking it from the remote user’s control.

If you modify your configuration file, the switch prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the CONFIG_FILE environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

This example shows how to reload the software on the switch on the current day at 7:30 p.m:

```
Switch# reload at 19:30
Reload scheduled for 19:30:00 UTC Wed Jun 5 1996 (in 2 hours and 25 minutes)
Proceed with reload? [confirm]
```

This example shows how to reload the software on the switch at a future time:

```
Switch# reload at 02:00 jun 20
Reload scheduled for 02:00:00 UTC Thu Jun 20 1996 (in 344 hours and 53 minutes)
Proceed with reload? [confirm]
```

To cancel a previously scheduled reload, use the `reload cancel` privileged EXEC command.
Displaying Scheduled Reload Information

To display information about a previously scheduled reload or to determine if a reload has been scheduled on the switch, use the `show reload` privileged EXEC command.

It displays reload information including the time the reload is scheduled to occur and the reason for the reload (if it was specified when the reload was scheduled).
Configuring Cisco IOS CNS Agents

This chapter describes how to configure the Cisco IOS CNS agents on the Catalyst 2950 or Catalyst 2955 switch. To use the feature described in this chapter, you must have the enhanced software image (EI) installed on your switch.

For complete configuration information for the Cisco Configuration Engine, see this URL on Cisco.com http://www.cisco.com/en/US/products/sw/netmgtsw/ps4617/tsd_products_support_series_home.html

Understanding Cisco Configuration Engine Software

The Cisco Configuration Engine is network management software that acts as a configuration service for automating the of network devices and services (see Figure 5-1). Each Configuration Engine manages a group of Cisco devices (switches and routers) and the services that they deliver, storing their configurations and delivering them as needed. The Configuration Engine automates initial configurations and configuration updates by generating device-specific configuration changes, sending them to the device, executing the configuration change, and logging the results.

The Configuration Engine supports standalone and server modes and has these CNS components:

- Configuration service (web server, file manager, and namespace mapping server)
- Event service (event gateway)
- Data service directory (data models and schema)

In standalone mode, the Configuration Engine supports an embedded Directory Service. In this mode, no external directory or other data store is required. In server mode, the Configuration Engine supports the use of a user-defined external directory.
These sections contain this conceptual information:

- Configuration Service, page 5-2
- Event Service, page 5-3
- What You Should Know About the CNS IDs and Device Hostnames, page 5-3

**Configuration Service**

The Configuration Service is the core component of the Cisco Configuration Engine. It consists of a configuration server that works with Cisco IOS CNS agents on the switch. The Configuration Service delivers device and service configurations to the switch for initial configuration and mass reconfiguration by logical groups. Switches receive their initial configuration from the Configuration Service when they start up on the network for the first time.
The Configuration Service uses the CNS Event Service to send and receive configuration change events and to send success and failure notifications.

The configuration server is a web server that uses configuration templates and the device-specific configuration information stored in the embedded (standalone mode) or remote (server mode) directory. Configuration templates are text files containing static configuration information in the form of CLI commands. In the templates, variables are specified using lightweight directory access protocol (LDAP) URLs that reference the device-specific configuration information stored in a directory.

The Cisco IOS agent can perform a syntax check on received configuration files and publish events to show the success or failure of the syntax check. The configuration agent can either apply configurations immediately or delay the application until receipt of a synchronization event from the configuration server.

**Event Service**

The Cisco Configuration Engine uses the Event Service for receipt and generation of configuration events. The event agent is on the switch and facilitates the communication between the switch and the event gateway on the Configuration Engine.

The Event Service is a highly capable publish-and-subscribe communication method. The Event Service uses subject-based addressing to send messages to their destinations. Subject-based addressing conventions define a simple, uniform namespace for messages and their destinations.

**NameSpace Mapper**

The Configuration Engine includes the NameSpace Mapper (NSM) that provides a lookup service for managing logical groups of devices based on application, device or group ID, and event. Cisco IOS devices recognize only event subject-names that match those configured in Cisco IOS software; for example, cisco.cns.config.load. You can use the namespace mapping service to designate events by using any desired naming convention. When you have populated your data store with your subject names, NSM changes your event subject-name strings to those known by Cisco IOS.

For a subscriber, when given a unique device ID and event, the namespace mapping service returns a set of events to which to subscribe. Similarly, for a publisher, when given a unique group ID, device ID, and event, the mapping service returns a set of events on which to publish.

**What You Should Know About the CNS IDs and Device Hostnames**

The Cisco Configuration Engine assumes that a unique identifier is associated with each configured switch. This unique identifier can take on multiple synonyms, where each synonym is unique within a particular namespace. The event service uses namespace content for subject-based addressing of messages.

The Configuration Engine intersects two namespaces, one for the event bus and the other for the configuration server. Within the scope of the configuration server namespace, the term ConfigID is the unique identifier for a device. Within the scope of the event bus namespace, the term DeviceID is the CNS unique identifier for a device.

Because the Configuration Engine uses both the event bus and the configuration server to provide configurations to devices, you must define both ConfigID and Device ID for each configured switch.
Within the scope of a single instance of the configuration server, no two configured switches can share the same value for ConfigID. Within the scope of a single instance of the event bus, no two configured switches can share the same value for DeviceID.

**ConfigID**

Each configured switch has a unique ConfigID, which serves as the key into the Configuration Engine directory for the corresponding set of switch CLI attributes. The ConfigID defined on the switch must match the ConfigID for the corresponding switch definition on the Configuration Engine.

The ConfigID is fixed at startup time and cannot be changed until the device restarts, even if the switch hostname is reconfigured.

**DeviceID**

Each configured switch participating on the event bus has a unique DeviceID, which is analogous to the switch source address so that the switch can be targeted as a specific destination on the bus. All switches configured with the `cns config partial` global configuration command must access the event bus. Therefore, the DeviceID, as originated on the switch, must match the DeviceID of the corresponding switch definition in the Configuration Engine.

The origin of the DeviceID is defined by the Cisco IOS hostname of the switch. However, the DeviceID variable and its usage reside within the event gateway adjacent to the switch.

The logical Cisco IOS termination point on the event bus is embedded in the event gateway, which in turn functions as a proxy on behalf of the switch. The event gateway represents the switch and its corresponding DeviceID to the event bus.

The switch declares its hostname to the event gateway immediately after the successful connection to the event gateway. The event gateway couples the DeviceID value to the Cisco IOS hostname each time this connection is established. The event gateway caches this DeviceID value for the duration of its connection to the switch.

**Hostname and DeviceID**

The DeviceID is fixed at the time of the connection to the event gateway and does not change even when the switch hostname is reconfigured.

When changing the switch hostname on the switch, the only way to refresh the DeviceID is to break the connection between the switch and the event gateway. Enter the `no cns event` global configuration command followed by the `cns event` global configuration command.

When the connection is re-established, the switch sends its modified hostname to the event gateway. The event gateway redefines the DeviceID to the new value.

⚠️ **Caution**

When using the Configuration Engine user interface, you must first set the DeviceID field to the hostname value that the switch acquires after—not before—you use the `cns config initial` global configuration command at the switch. Otherwise, subsequent `cns config partial` global configuration command operations malfunction.
Using Hostname, DeviceID, and ConfigID

In standalone mode, when a hostname value is set for a switch, the configuration server uses the hostname as the DeviceID when an event is sent on hostname. If the hostname has not been set, the event is sent on the cn=<value> of the device.

In server mode, the hostname is not used. In this mode, the unique DeviceID attribute is always used for sending an event on the bus. If this attribute is not set, you cannot update the switch.

These and other associated attributes (tag value pairs) are set when you run Setup on the Configuration Engine.

Note

For more information about running the setup program on the Configuration Engine, see the Configuration Engine setup and configuration guide at this URL on cisco.com:

Understanding Cisco IOS Agents

The CNS event agent feature allows the switch to publish and subscribe to events on the event bus and works with the Cisco IOS agent. The Cisco IOS agent feature supports the switch by providing these features:

- Initial Configuration, page 5-5
- Incremental (Partial) Configuration, page 5-6
- Synchronized Configuration, page 5-6

Initial Configuration

When the switch first comes up, it attempts to get an IP address by broadcasting a DHCP request on the network. Assuming there is no DHCP server on the subnet, the distribution switch acts as a DHCP relay agent and forwards the request to the DHCP server. Upon receiving the request, the DHCP server assigns an IP address to the new switch and includes the TFTP server IP address, the path to the bootstrap configuration file, and the default gateway IP address in a unicast reply to the DHCP relay agent. The DHCP relay agent forwards the reply to the switch.

The switch automatically configures the assigned IP address on interface VLAN 1 (the default) and downloads the bootstrap configuration file from the TFTP server. Upon successful download of the bootstrap configuration file, the switch loads the file in its running configuration.

The Cisco IOS agents initiate communication with the Configuration Engine by using the appropriate ConfigID and EventID. The Configuration Engine maps the Config ID to a template and downloads the full configuration file to the switch.

Figure 5-2 shows a sample network configuration for retrieving the initial bootstrap configuration file by using DHCP-based autoconfiguration.
Incremental (Partial) Configuration

After the network is running, new services can be added by using the Cisco IOS agent. Incremental (partial) configurations can be sent to the switch. The actual configuration can be sent as an event payload by way of the event gateway (push operation) or as a signal event that triggers the switch to initiate a pull operation.

The switch can check the syntax of the configuration before applying it. If the syntax is correct, the switch applies the incremental configuration and publishes an event that signals success to the configuration server. If the switch does not apply the incremental configuration, it publishes an event showing an error status. When the switch has applied the incremental configuration, it can write it to NVRAM or wait until signaled to do so.

Synchronized Configuration

When the switch receives a configuration, it can defer application of the configuration upon receipt of a write-signal event. The write-signal event tells the switch not to save the updated configuration into its NVRAM. The switch uses the updated configuration as its running configuration. This ensures that the switch configuration is synchronized with other network activities before saving the configuration in NVRAM for use at the next reboot.
Configuring Cisco IOS Agents

The Cisco IOS agents embedded in the switch Cisco IOS software allow the switch to be connected and automatically configured as described in the “Enabling Automated CNS Configuration” section on page 5-7. If you want to change the configuration or install a custom configuration, see these sections for instructions:

- Enabling the CNS Event Agent, page 5-8
- Enabling the Cisco IOS CNS Agent, page 5-9

Enabling Automated CNS Configuration

To enable automated CNS configuration of the switch, you must first complete the prerequisites in Table 5-1. When you complete them, power on the switch. At the setup prompt, do nothing: The switch begins the initial configuration as described in the “Initial Configuration” section on page 5-5. When the full configuration file is loaded on your switch, you need to do nothing else.

Table 5-1 Prerequisites for Enabling Automatic Configuration

<table>
<thead>
<tr>
<th>Device</th>
<th>Required Configuration</th>

<tr>
<td>CNS Configuration Engine</td>
<td>One or more templates for each type of device, with the ConfigID of the device mapped to the template.</td>
</tr>
</tbody>
</table>

Note

For more information about running the setup program and creating templates on the Configuration Engine, see the Cisco Configuration Engine Installation and Setup Guide, 1.5 for Linux at this URL: http://www.cisco.com/en/US/products/sw/netmgts/sw/ps4617/products_installation_and_configuration_guide_book09186a00803b59db.html
Enabling the CNS Event Agent

You must enable the CNS event agent on the switch before you enable the CNS configuration agent.

Beginning in privileged EXEC mode, follow these steps to enable the CNS event agent on the switch:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2.</td>
<td>cns event {ip-address</td>
<td>hostname} [port-number] [backup] [init-retry retry-count] [keepalive seconds retry-count] [source ip-address]</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For {ip-address</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For port number, enter the port number for the event gateway. The default port number is 11011.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) Enter backup to show that this is the backup gateway. (If omitted, this is the primary gateway.)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For init-retry retry-count, enter the number of initial retries before switching to backup. The default is 3.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For keepalive seconds, enter how often the switch sends keepalive messages. For retry-count, enter the number of unanswered keepalive messages that the switch sends before the connection is terminated. The default for each is 0.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For source ip-address, enter the source IP address of this device.</td>
</tr>
</tbody>
</table>
|       |                                              | Note: Though visible in the command-line help string, the encrypt and force-fmt1 keywords are not supported.

To disable the CNS event agent, use the no cns event {ip-address | hostname} global configuration command.

This example shows how to enable the CNS event agent, set the IP address gateway to 10.180.1.27, set 120 seconds as the keepalive interval, and set 10 as the retry count.

`Switch(config)# cns event 10.180.1.27 keepalive 120 10`
Enabling the Cisco IOS CNS Agent

After enabling the CNS event agent, start the Cisco IOS CNS agent on the switch. You can enable the Cisco IOS agent with these commands:

- The `cns config initial` global configuration command enables the Cisco IOS agent and initiates an initial configuration on the switch.
- The `cns config partial` global configuration command enables the Cisco IOS agent and initiates a partial configuration on the switch. You can then use the Configuration Engine to remotely send incremental configurations to the switch.

Enabling an Initial Configuration

Beginning in privileged EXEC mode, follow these steps to enable the CNS configuration agent and initiate an initial configuration on the switch:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>cns config connect-intf interface-prefix [ping-interval seconds] [retries num]</td>
<td>Enter the connect-interface-config submode, and specify the interface for connecting to the Configuration Engine.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Enter the <code>interface-prefix</code> for the connecting interface. You must specify the interface type but need not specify the interface number.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- (Optional) For <code>ping-interval seconds</code>, enter the interval between successive ping attempts. The range is 1 to 30 seconds. The default is 10 seconds.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- (Optional) For <code>retries num</code>, enter the number of ping retries. The range is 1 to 30. The default is 5.</td>
</tr>
<tr>
<td>3</td>
<td>config-cli \ or \ line-cli</td>
<td>Enter <code>config-cli</code> to connect to the Configuration Engine through the interface defined in <code>cns config connect-intf</code>. Enter <code>line-cli</code> to connect to the Configuration Engine through modem dialup lines.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong>: The <code>config-cli</code> interface configuration command accepts the special character &amp; that acts as a placeholder for the interface name. When the configuration is applied, the &amp; is replaced with the interface name. For example, to connect through FastEthernet0/1, the command <code>config-cli ip route 0.0.0.0 0.0.0.0 &amp;</code> generates the command <code>ip route 0.0.0.0 0.0.0.0 FastEthernet0/1</code>.</td>
</tr>
<tr>
<td>4</td>
<td>exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>5</td>
<td>hostname name</td>
<td>Enter the hostname for the switch.</td>
</tr>
<tr>
<td>6</td>
<td>ip route network-number</td>
<td>Establish a static route to the Configuration Engine whose IP address is <code>network-number</code>.</td>
</tr>
</tbody>
</table>
Step 7

```
cns id interface num [ dns-reverse | ipaddress | mac-address ] [ event ]
or
```
cns id [ hardware-serial | hostname | string string ] [ event ]

Set the unique EventID or ConfigID used by the Configuration Engine.

- For `interface num`, enter the type of interface—for example, Ethernet, Group-Async, Loopback, or Virtual-Template. This setting specifies from which interface the IP or MAC address should be retrieved to define the unique ID.
- For `{ dns-reverse | ipaddress | mac-address }` enter `dns-reverse` to retrieve the hostname and assign it as the unique ID, enter `ipaddress` to use the IP address, or enter `mac-address` to use the MAC address as the unique ID.
- (Optional) Enter `event` to set the ID to be the event-id value used to identify the switch.
- For `{ hardware-serial | hostname | string string }`, enter `hardware-serial` to set the switch serial number as the unique ID, enter `hostname` (the default) to select the switch hostname as the unique ID, or enter an arbitrary text string for `string string` as the unique ID.

Step 8

```
cns config initial [ ip-address | hostname ] [ port-number ] [ event ] [ no-persist ] [ page page ] [ source ip-address ] [ syntax-check ]
```

Enable the Cisco IOS agent, and initiate an initial configuration.

- For `{ ip-address | hostname }`, enter the IP address or the hostname of the configuration server.
- (Optional) For `port-number`, enter the port number of the configuration server. The default port number is 80.
- (Optional) Enable `event` for configuration success, failure, or warning messages when the configuration is finished.
- (Optional) Enable `no-persist` to suppress the automatic writing to NVRAM of the configuration pulled as a result of entering the `cns config initial` global configuration command. If the `no-persist` keyword is not entered, using the `cns config initial` command causes the resultant configuration to be automatically written to NVRAM.
- (Optional) For `page page`, enter the web page of the initial configuration. The default is /Config/config/asp.
- (Optional) Enter `source ip-address` to use for source IP address.
- (Optional) Enable `syntax-check` to check the syntax when this parameter is entered.

Note: Though visible in the command-line help string, the `encrypt` keyword is not supported.

Step 9

```
end
```

Return to privileged EXEC mode.
Configuring Cisco IOS CNS Agents

Chapter 5

To disable the CNS Cisco IOS agent, use the `no cns config initial {ip-address | hostname}` global configuration command.

This example shows how to configure an initial configuration on a remote switch. The switch hostname is the unique ID. The Cisco Configuration Engine IP address is 172.28.129.22.

```
Switch(config)# cns config connect-intf serial ping-interval 1 retries 1
Switch(config-cns-conn-if)# config-cli ip address negotiated
Switch(config-cns-conn-if)# config-cli encapsulation ppp
Switch(config-cns-conn-if)# config-cli ip directed-broadcast
Switch(config-cns-conn-if)# config-cli no keepalive
Switch(config-cns-conn-if)# config-cli no shutdown
Switch(config-cns-conn-if)# exit
Switch(config)# hostname RemoteSwitch
RemoteSwitch(config)# ip route 10.1.1.1 255.255.255.255 11.11.11.1
RemoteSwitch(config)# cns id Ethernet 0 ipaddress
RemoteSwitch(config)# cns config initial 10.1.1.1 no-persist
```

Enabling a Partial Configuration

Beginning in privileged EXEC mode, follow these steps to enable the Cisco IOS agent and to initiate a partial configuration on the switch:

```
<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 10 show cns config connections</td>
<td>Verify information about the configuration agent.</td>
</tr>
<tr>
<td>Step 11 show running-config</td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>
```

To disable the CNS Cisco IOS agent, use the `no cns config partial {ip-address | hostname}` global configuration command. To cancel a partial configuration, use the `cns config cancel` privileged EXEC command.

---

### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 cns config partial {ip-address \ hostname} [port-number] [source ip-address]</td>
<td>Enable the configuration agent, and initiate a partial configuration.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show cns config stats</td>
<td>Verify information about the configuration agent.</td>
</tr>
<tr>
<td>or show cns config outstanding</td>
<td></td>
</tr>
<tr>
<td>Step 5 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

---

### Note

Though visible in the command-line help string, the `encrypt` keyword is not supported.
Displaying CNS Configuration

You can use the privileged EXEC commands in Table 5-2 to display CNS configuration information.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show cns config connections</code></td>
<td>Displays the status of the CNS Cisco IOS agent connections.</td>
</tr>
<tr>
<td><code>show cns config outstanding</code></td>
<td>Displays information about incremental (partial) CNS configurations that have started but are not yet completed.</td>
</tr>
<tr>
<td><code>show cns config stats</code></td>
<td>Displays statistics about the Cisco IOS agent.</td>
</tr>
<tr>
<td><code>show cns event connections</code></td>
<td>Displays the status of the CNS event agent connections.</td>
</tr>
<tr>
<td><code>show cns event stats</code></td>
<td>Displays statistics about the CNS event agent.</td>
</tr>
<tr>
<td><code>show cns event subject</code></td>
<td>Displays a list of event agent subjects that are subscribed to by applications.</td>
</tr>
</tbody>
</table>
Clustering Switches

This chapter provides the concepts and procedures to create and manage Catalyst 2950 and 2955 switch clusters.

You can create and manage switch clusters by using Cisco Network Assistant (hereafter known as Network Assistant), the command-line interface (CLI), or SNMP. For complete procedures, see the online help. For the CLI cluster commands, see the switch command reference.

Note

Network Assistant supports switch clusters, but we recommend that you instead group switches into communities. Network Assistant has a Cluster Conversion Wizard to help you convert the cluster to a community. For more information about Network Assistant, including introductory information on managing switch clusters and converting a switch cluster to a community, see Getting Started with Cisco Network Assistant, available on Cisco.com.

This chapter focuses on Catalyst 2950 and 2955 switch clusters. It also includes guidelines and limitations for clusters mixed with other cluster-capable Catalyst switches, but it does not provide complete descriptions of the cluster features for these other switches. For complete cluster information for a specific Catalyst platform, refer to the software configuration guide for that switch.

This chapter consists of these sections:

- Understanding Switch Clusters, page 6-1
- Planning a Switch Cluster, page 6-4
- Using SNMP to Manage Switch Clusters, page 6-14

Note

We do not recommend using the ip http access-class global configuration command to limit access to specific hosts or networks. Access should be controlled through the cluster command switch or by applying access control lists (ACLs) on interfaces that are configured with IP address. For more information on ACLs, see Chapter 28, “Configuring Network Security with ACLs.”

Understanding Switch Clusters

A switch cluster is a set of up to 16 connected, cluster-capable Catalyst switches that are managed as a single entity. The switches in the cluster use the switch clustering technology so that you can configure and troubleshoot a group of different Catalyst desktop switch platforms through a single IP address.
In a switch cluster, 1 switch must be the *cluster command switch* and up to 15 other switches can be *cluster member switches*. The total number of switches in a cluster cannot exceed 16 switches. The cluster command switch is the single point of access used to configure, manage, and monitor the cluster member switches. Cluster members can belong to only one cluster at a time.

The benefits of clustering switches include:

- Management of Catalyst switches regardless of their interconnection media and their physical locations. The switches can be in the same location, or they can be distributed across a network.

  Cluster members are connected to the cluster command switch according to the connectivity guidelines described in the “Automatic Discovery of Cluster Candidates and Members” section on page 6-5. This section includes management VLAN considerations for the Catalyst 1900, Catalyst 2820, Catalyst 2900 XL, Catalyst 2950, and Catalyst 3500 XL switches. For complete information about these switches in a switch-cluster environment, refer to the software configuration guide for that specific switch.

- Command-switch redundancy if a cluster command switch fails. One or more switches can be designated as *standby cluster command switches* to avoid loss of contact with cluster members. A *cluster standby group* is a group of standby cluster command switches.

- Management of a variety of Catalyst switches through a single IP address. This conserves on IP addresses, especially if you have a limited number of them. All communication with the switch cluster is through the cluster command switch IP address.

Table 6-1 lists the Catalyst switches eligible for switch clustering, including which ones can be cluster command switches and which ones can only be cluster member switches, and the required software versions.

### Cluster Command Switch Characteristics

A Catalyst 2950 or Catalyst 2955 cluster command switch must meet these requirements:

- It is running Cisco IOS Release 12.0(5.2)WC(1) or later.
• It has an IP address.
• It has Cisco Discovery Protocol (CDP) version 2 enabled (the default).
• It is not a command or cluster member switch of another cluster.
• A Catalyst 2955 command switch is connected to the standby cluster command switches through the management VLAN and to the cluster member switches through a common VLAN.
• A Catalyst 2950 Long-Reach Ethernet (LRE) command switch is connected to the standby command switches through the management VLAN and to the member switches through a common VLAN.
• If a non-LRE Catalyst 2950 command switch is running Cisco IOS Release 12.1(9)EA1 or later, it is connected to the standby command switches through the management VLAN and to the member switches through a common VLAN.
• If a non-LRE Catalyst 2950 command switch is running a release earlier than Cisco IOS Release 12.1(9)EA1, it is connected to the standby command switches and member switches through its management VLAN.

![Note]

The CMP-NAT-ACL access list is created when a device is configured as the command switch. Configuring any other access list on the switch can restrict access to it and affect the discovery of member and candidate switches.

We strongly recommend that the highest-end, command-capable switch in the cluster be the command switch:

• If your switch cluster has a Catalyst 3550 switch, that switch should be the command switch.
• If your switch cluster has Catalyst 2900 XL, Catalyst 2940, Catalyst 2950, Catalyst 2955, and Catalyst 3500 XL switches, the Catalyst 2950 or the Catalyst 2955 should be the command switch.

**Standby Cluster Command Switch Characteristics**

A standby cluster command switch must meet these requirements:

• It is running Cisco IOS 12.0(5.2)WC(1)) or later.
• It has an IP address.
• It has CDP version 2 enabled.
• A Catalyst 2955 standby command switch is connected to other standby switches through its management VLAN and to all member switches through a common VLAN.
• A Catalyst 2950 LRE standby command switch is connected to other standby switches through its management VLAN and to all member switches through a common VLAN.
• If a non-LRE Catalyst 2950 standby command switch is running Cisco IOS Release 12.1(9)EA1 or later, it is connected to other standby switches through its management VLAN and to all member switches through a common VLAN.
• If a non-LRE Catalyst 2950 standby command switch is running a release earlier than Cisco IOS Release 12.1(9)EA1, it is connected to the command switch and to other standby command switches and member switches through its management VLAN.
Chapter 6  Clustering Switches

Planning a Switch Cluster

Anticipating conflicts and compatibility issues is a high priority when you manage several switches through a cluster. This section describes these guidelines, requirements, and caveats that you should understand before you create the cluster:

- Automatic Discovery of Cluster Candidates and Members, page 6-5
- HSRP and Standby Cluster Command Switches, page 6-9

Candidate Switch and Member Switch Characteristics

Candidate switches are cluster-capable switches that have not yet been added to a cluster. Cluster member switches are switches that have actually been added to a switch cluster. Although not required, a candidate or cluster member switch can have its own IP address and password.

To join a cluster, a candidate switch must meet these requirements:

- It is running cluster-capable software.
- It has CDP Version 2 enabled.
- It is not a command or member switch of another cluster.
- A Catalyst 2950 LRE or Catalyst 2955 member or candidate switch is connected to the command switch through at least one common VLAN.
- If a non-LRE Catalyst 2950 member or candidate switch is running Cisco IOS Release 12.1(9)EA1 or later, it is connected to the command switch through at least one common VLAN.
- If a non-LRE Catalyst 2950 member or candidate switch is running a release earlier than Cisco IOS Release 12.1(9)EA1, it is connected to the command switch through the command-switch management VLAN.

Planning a Switch Cluster

Anticipating conflicts and compatibility issues is a high priority when you manage several switches through a cluster. This section describes these guidelines, requirements, and caveats that you should understand before you create the cluster:

- Automatic Discovery of Cluster Candidates and Members, page 6-5
- HSRP and Standby Cluster Command Switches, page 6-9
Automatic Discovery of Cluster Candidates and Members

The cluster command switch uses Cisco Discovery Protocol (CDP) to discover cluster member switches, candidate switches, neighboring switch clusters, and edge devices across multiple VLANs and in star or cascaded topologies.

Note

Do not disable CDP on the cluster command switch, on cluster members, or on any cluster-capable switches that you might want a cluster command switch to discover. For more information about CDP, see Chapter 23, “Configuring CDP.”

Following these connectivity guidelines ensures automatic discovery of the switch cluster, cluster candidates, connected switch clusters, and neighboring edge devices:

- Discovery Through CDP Hops, page 6-5
- Discovery Through Non-CDP-Capable and Noncluster-Capable Devices, page 6-6
- Discovery Through Different VLANs, page 6-7
- Discovery Through Different Management VLANs, page 6-7
- Discovery of Newly Installed Switches, page 6-8

Discovery Through CDP Hops

By using CDP, a cluster command switch can discover switches up to seven CDP hops away (the default is three hops) from the edge of the cluster. The edge of the cluster is where the last cluster member switches are connected to the cluster and to candidate switches. For example, cluster member switches 9 and 10 in Figure 6-1 are at the edge of the cluster.

In Figure 6-1, the cluster command switch has ports assigned to VLANs 16 and 62. The CDP hop count is three. The cluster command switch discovers switches 11, 12, 13, and 14 because they are within three hops from the edge of the cluster. It does not discover switch 15 because it is four hops from the edge of the cluster.
Discovery Through Non-CDP-Capable and Noncluster-Capable Devices

If a cluster command switch is connected to a non-CDP-capable third-party hub (such as a non-Cisco hub), it can discover cluster-enabled devices connected to that third-party hub. However, if the cluster command switch is connected to a noncluster-capable Cisco device, it cannot discover a cluster-enabled device connected beyond the noncluster-capable Cisco device.

Figure 6-2 shows that the cluster command switch discovers the switch that is connected to a third-party hub. However, the cluster command switch does not discover the switch that is connected to a Catalyst 5000 switch.
Discovery Through Different VLANs

If the cluster command switch is a Catalyst 2940, Catalyst 2950, Catalyst 2955, or Catalyst 3550 switch, the cluster can have cluster member switches in different VLANs. As cluster member switches, they must be connected through at least one VLAN in common with the cluster command switch. The cluster command switch in Figure 6-3 has ports assigned to VLANs 9, 16, and 62 and therefore discovers the switches in those VLANs. It does not discover the switch in VLAN 50. It also does not discover the switch in VLAN 16 in the first column because the cluster command switch has no VLAN connectivity to it.

Catalyst 2900 XL, Catalyst 2950, and Catalyst 3500 XL cluster member switches must be connected to the cluster command switch through their management VLAN. For information about discovery through management VLANs, see the “Discovery Through Different Management VLANs” section on page 6-7. For more information about VLANs, see Chapter 16, “Configuring VLANs.”

![Figure 6-3 Discovery Through Different VLANs](image)

Discovery Through Different Management VLANs

Catalyst cluster command switches can discover and manage cluster member switches in different VLANs and different management VLANs. As cluster member switches, they must be connected through at least one VLAN in common with the cluster command switch. They do not need to be connected to the cluster command switch through their management VLAN. The default management VLAN is VLAN 1.

The cluster command switch and standby command switch in Figure 6-4 (assuming they are Catalyst cluster command switches) have ports assigned to VLANs 9, 16, and 62. The management VLAN on the cluster command switch is VLAN 9. Each cluster command switch discovers the switches in the different management VLANs except these:

- Switches 7 and 10 (switches in management VLAN 4) because they are not connected through a common VLAN (meaning VLANs 62 and 9) with the cluster command switch
• Switch 9 because automatic discovery does not extend beyond a noncandidate device, which is switch 7

**Figure 6-4**  Discovery Through Different Management VLANs with a Layer 3 Cluster Command Switch

- Devices 3 and 5 (management VLAN 16) belong to VLAN 16.
- Device 7 belongs to VLAN 62 and VLAN trunk 4, 62.
- Device 8 belongs to VLAN 9.
- Device 9 belongs to VLAN 62.
- Device 10 belongs to VLAN 4.
- Device 6 belongs to VLAN 9.

**Discovery of Newly Installed Switches**

To join a cluster, the new, out-of-the-box switch must be connected to the cluster through one of its access ports. An access port (AP) carries the traffic of and belongs to only one VLAN. By default, the new switch and its access ports are assigned to VLAN 1.

When the new switch joins a cluster, its default VLAN changes to the VLAN of the immediately upstream neighbor. The new switch also configures its access port to belong to the VLAN of the immediately upstream neighbor.

The cluster command switch in **Figure 6-5** belongs to VLANs 9 and 16. When new cluster-capable switches join the cluster:

- One cluster-capable switch and its access port are assigned to VLAN 9.
- The other cluster-capable switch and its access port are assigned to management VLAN 16.
HSRP and Standby Cluster Command Switches

The switch uses Hot Standby Router Protocol (HSRP) so that you can configure a group of standby cluster command switches. Because a cluster command switch manages the forwarding of all communication and configuration information to all the cluster member switches, we strongly recommend the following:

- For a cluster command switch stack, a standby cluster command switch is necessary if the entire switch stack fails. However, if only the stack master in the command switch stack fails, the switch stack elects a new stack master and resumes its role as the cluster command switch stack.
- For a cluster command switch that is a standalone switch, configure a standby cluster command switch to take over if the primary cluster command switch fails.

A cluster standby group is a group of command-capable switches that meet the requirements described in the “Note The CMP-NAT-ACL access list is created when a device is configured as the command switch. Configuring any other access list on the switch can restrict access to it and affect the discovery of member and candidate switches.” section on page 6-3. Only one cluster standby group can be assigned per cluster.

The switches in the cluster standby group are ranked according to HSRP priorities. The switch with the highest priority in the group is the active cluster command switch (AC). The switch with the next highest priority is the standby cluster command switch (SC). The other switches in the cluster standby group are the passive cluster command switches (PC). If the active cluster command switch and the standby cluster command switch become disabled at the same time, the passive cluster command switch with the highest priority becomes the active cluster command switch. For the limitations to automatic discovery, see the “Automatic Recovery of Cluster Configuration” section on page 6-11.

The HSRP standby hold time interval should be greater than or equal to three times the hello time interval. The default HSRP standby hold time interval is 10 seconds. The default HSRP standby hello time interval is 3 seconds.

These connectivity guidelines ensure automatic discovery of the switch cluster, cluster candidates, connected switch clusters, and neighboring edge devices. These topics also provide more detail about standby cluster command switches:

- Virtual IP Addresses, page 6-10
Virtual IP Addresses

You need to assign a unique virtual IP address and group number and name to the cluster standby group. This information must be configured on a specific VLAN or routed port on the active cluster command switch. The active cluster command switch receives traffic destined for the virtual IP address. To manage the cluster, you must access the active cluster command switch through the virtual IP address, not through the command-switch IP address. This is in case the IP address of the active cluster command switch is different from the virtual IP address of the cluster standby group.

If the active cluster command switch fails, the standby cluster command switch assumes ownership of the virtual IP address and becomes the active cluster command switch. The passive switches in the cluster standby group compare their assigned priorities to decide the new standby cluster command switch. The passive standby switch with the highest priority then becomes the standby cluster command switch. When the previously active cluster command switch becomes active again, it resumes its role as the active cluster command switch, and the current active cluster command switch becomes the standby cluster command switch again. For more information about IP address in switch clusters, see the “IP Addresses” section on page 6-12.

Other Considerations for Cluster Standby Groups

These requirements also apply:

- Standby cluster command switches must be the same type of switches as the cluster command switch. For example, if the cluster command switch is a Catalyst 2950 and 2955 switch, the standby cluster command switches must also be Catalyst 2950 and 2955 switches. Refer to the switch configuration guide of other cluster-capable switches for their requirements on standby cluster command switches.

- Only one cluster standby group can be assigned to a cluster. You can have more than one router-redundancy standby group.

- All standby-group members must be members of the cluster.

*Note* There is no limit to the number of switches that you can assign as standby cluster command switches. However, the total number of switches in the cluster—which would include the active cluster command switch, standby-group members, and cluster member switches—cannot be more than 16.

- Each standby-group member (Figure 6-6) must be connected to the cluster command switch through the same VLAN. Each standby-group member must also be redundantly connected to each other through at least one VLAN in common with the switch cluster.

Catalyst 1900, Catalyst 2820, Catalyst 2900 XL, Catalyst 2950, and Catalyst 3500 XL cluster member switches must be connected to the cluster standby group through their management VLANs. For more information about VLANs in switch clusters, see these sections:

- “Discovery Through Different VLANs” section on page 6-7
- “Discovery Through Different Management VLANs” section on page 6-7
Automatic Recovery of Cluster Configuration

The active cluster command switch continually forwards cluster-configuration information (but not device-configuration information) to the standby cluster command switch. This ensures that the standby cluster command switch can take over the cluster immediately after the active cluster command switch fails.

Automatic discovery has these limitations:

- This limitation applies only to clusters that have Catalyst 2950, Catalyst 3550, Catalyst 3560, and Catalyst 3750 command and standby cluster command switches: If the active cluster command switch and standby cluster command switch become disabled at the same time, the passive cluster command switch with the highest priority becomes the active cluster command switch. However, because it was a passive standby cluster command switch, the previous cluster command switch did not forward cluster-configuration information to it. The active cluster command switch only forwards cluster-configuration information to the standby cluster command switch. You must therefore rebuild the cluster.

- This limitation applies to all clusters: If the active cluster command switch fails and there are more than two switches in the cluster standby group, the new cluster command switch does not discover any Catalyst 1900, Catalyst 2820, and Catalyst 2916M XL cluster member switches. You must re-add these cluster member switches to the cluster.

- This limitation applies to all clusters: If the active cluster command switch fails and becomes active again, it does not discover any Catalyst 1900, Catalyst 2820, and Catalyst 2916M XL cluster member switches. You must again add these cluster member switches to the cluster.

When the previously active cluster command switch resumes its active role, it receives a copy of the latest cluster configuration from the active cluster command switch, including members that were added while it was down. The active cluster command switch sends a copy of the cluster configuration to the cluster standby group.
Chapter 6    Clustering Switches

IP Addresses

You must assign IP information to a cluster command switch. You can assign more than one IP address to the cluster command switch, and you can access the cluster through any of the command-switch IP addresses. If you configure a cluster standby group, you must use the standby-group virtual IP address to manage the cluster from the active cluster command switch. Using the virtual IP address ensures that you retain connectivity to the cluster if the active cluster command switch fails and that a standby cluster command switch becomes the active cluster command switch.

If the active cluster command switch fails and the standby cluster command switch takes over, you must either use the standby-group virtual IP address or any of the IP addresses available on the new active cluster command switch to access the cluster.

You can assign an IP address to a cluster-capable switch, but it is not necessary. A cluster member switch is managed and communicates with other cluster member switches through the command-switch IP address. If the cluster member switch leaves the cluster and it does not have its own IP address, you must assign an IP address to manage it as a standalone switch.

For more information about IP addresses, see Chapter 4, “Assigning the Switch IP Address and Default Gateway.”

Hostnames

You do not need to assign a host name to either a cluster command switch or an eligible cluster member. However, a hostname assigned to the cluster command switch can help to identify the switch cluster. The default hostname for the switch is Switch.

If a switch joins a cluster and it does not have a hostname, the cluster command switch appends a unique member number to its own hostname and assigns it sequentially as each switch joins the cluster. The number means the order in which the switch was added to the cluster. For example, a cluster command switch named eng-cluster could name the fifth cluster member eng-cluster-5.

If a switch has a hostname, it retains that name when it joins a cluster and when it leaves the cluster. If a switch received its hostname from the cluster command switch, was removed from a cluster, was then added to a new cluster, and kept the same member number (such as 5), the switch overwrites the old hostname (such as eng-cluster-5) with the hostname of the cluster command switch in the new cluster (such as mkg-cluster-5). If the switch member number changes in the new cluster (such as 3), the switch retains the previous name (eng-cluster-5).

Passwords

You do not need to assign passwords to an individual switch if it will be a cluster member. When a switch joins a cluster, it inherits the command-switch password and retains it when it leaves the cluster. If no command-switch password is configured, the cluster member switch inherits a null password. Cluster member switches only inherit the command-switch password.

If you change the member-switch password to be different from the command-switch password and save the change, the switch is not manageable by the cluster command switch until you change the member-switch password to match the command-switch password. Rebooting the member switch does not revert the password back to the command-switch password. We recommend that you do not change the member-switch password after it joins a cluster.

For more information about passwords, see the “Preventing Unauthorized Access to Your Switch” section on page 8-1.
For password considerations specific to the Catalyst 1900 and Catalyst 2820 switches, refer to the installation and configuration guides for those switches.

**SNMP Community Strings**

A cluster member switch inherits the command-switch first read-only (RO) and read-write (RW) community strings with @esN appended to the community strings:

- `command-switch-readonly-community-string@esN`, where N is the member-switch number.
- `command-switch-readwrite-community-string@esN`, where N is the member-switch number.

If the cluster command switch has multiple read-only or read-write community strings, only the first read-only and read-write strings are propagated to the cluster member switch.

The switches support an unlimited number of community strings and string lengths. For more information about SNMP and community strings, see Chapter 27, “Configuring SNMP.”

For SNMP considerations specific to the Catalyst 1900 and Catalyst 2820 switches, refer to the installation and configuration guides specific to those switches.

**TACACS+ and RADIUS**

If Terminal Access Controller Access Control System Plus (TACACS+) is configured on a cluster member, it must be configured on all cluster members. Similarly, if RADIUS is configured on a cluster member, it must be configured on all cluster members. Further, the same switch cluster cannot have some members configured with TACACS+ and other members configured with RADIUS.

For more information about TACACS+, see the “Controlling Switch Access with TACACS+” section on page 8-10. For more information about RADIUS, see the “Controlling Switch Access with RADIUS” section on page 8-17.

**LRE Profiles**

A configuration conflict occurs if a switch cluster has Long-Reach Ethernet (LRE) switches that use both private and public profiles. If one LRE switch in a cluster is assigned a public profile, all LRE switches in that cluster must have that same public profile. Before you add an LRE switch to a cluster, make sure that you assign it the same public profile used by other LRE switches in the cluster.

A cluster can have a mix of LRE switches that use different private profiles.

You can configure member switches from the CLI by first logging into the command switch. Enter the `rcommand` user EXEC command and the member switch number to start a Telnet session (through a or Telnet connection) and to access the member switch CLI. The command mode changes, and the CLI commands operate as usual. Enter the `exit` privileged EXEC command on the member switch to return to the command-switch CLI.

This example shows how to log into member-switch 3 from the command-switch CLI:

```
switch# rcommand 3
```

If you do not know the member-switch number, enter the `show cluster members` privileged EXEC command on the command switch. For more information about the `rcommand` command and all other cluster commands, see the switch command reference.
The Telnet session accesses the member-switch CLI at the same privilege level as on the command switch. The CLI commands then operate as usual. For instructions on configuring the switch for a Telnet session, see the “Disabling Password Recovery” section on page 6-5.

### Catalyst 1900 and Catalyst 2820 CLI Considerations

If your switch cluster has Catalyst 1900 and Catalyst 2820 switches running standard edition software, the Telnet session accesses the management console (a menu-driven interface) if the command switch is at privilege level 15. If the command switch is at privilege level 1 to 14, you are prompted for the password to access the menu console.

**Note**  Catalyst 1900, 2900 XL (4 MB), and 2820 switches are not supported in Network Assistant. The switches appear as unknown members in the Network Assistant Front Panel and Topology views.

Command-switch privilege levels map to the Catalyst 1900 and Catalyst 2820 member switches running standard and Enterprise Edition Software as follows:

- If the command-switch privilege level is 1 to 14, the member switch is accessed at privilege level 1.
- If the command-switch privilege level is 15, the member switch is accessed at privilege level 15.

**Note**  The Catalyst 1900 and Catalyst 2820 CLI is available only on switches running Enterprise Edition Software.

For more information about the Catalyst 1900 and Catalyst 2820 switches, see the installation and configuration guides for those switches.

### Using SNMP to Manage Switch Clusters

When you first power on the switch, SNMP is enabled if you enter the IP information by using the setup program and accept its proposed configuration. If you did not use the setup program to enter the IP information and SNMP was not enabled, you can enable it as described in the “Configuring SNMP” section on page 27-5. On Catalyst 1900 and Catalyst 2820 switches, SNMP is enabled by default.

When you create a cluster, the command switch manages the exchange of messages between member switches and an SNMP application. The cluster software on the command switch appends the member switch number (@esN, where N is the switch number) to the first configured read-write and read-only community strings on the command switch and propagates them to the member switch. The command switch uses this community string to control the forwarding of gets, sets, and get-next messages between the SNMP management station and the member switches.

**Note**  When a cluster standby group is configured, the command switch can change without your knowledge. Use the first read-write and read-only community strings to communicate with the command switch if there is a cluster standby group configured for the cluster.

If the member switch does not have an IP address, the command switch redirects traps from the member switch to the management station, as shown in Figure 6-7. If a member switch has its own IP address and community strings, the member switch can send traps directly to the management station, without going through the command switch.
If a member switch has its own IP address and community strings, they can be used in addition to the access provided by the command switch. For more information about SNMP and community strings, see Chapter 27, “Configuring SNMP.”

Administering the Switch

This chapter describes how to perform one-time operations to administer your Catalyst 2950 or Catalyst 2955. This chapter consists of these sections:

- Managing the System Time and Date, page 7-1
- Configuring a System Name and Prompt, page 7-14
- Creating a Banner, page 7-17
- Managing the MAC Address Table, page 7-19
- Managing the ARP Table, page 7-26

Managing the System Time and Date

You can manage the system time and date on your switch using automatic configuration, such as the Network Time Protocol (NTP), or manual configuration methods.

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference for Cisco IOS.

This section contains this configuration information:

- Understanding the System Clock, page 7-1
- Understanding Network Time Protocol, page 7-2
- Configuring NTP, page 7-3
- Configuring Time and Date Manually, page 7-11

Understanding the System Clock

The heart of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

- Network Time Protocol
- Manual configuration
The system clock can provide time to these services:
- User show commands
- Logging and debugging messages

The system clock keeps track of time internally based on Universal Time Coordinated (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is authoritative or not (that is, whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed. For configuration information, see the “Configuring Time and Date Manually” section on page 7-11.

Understanding Network Time Protocol

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP uses the concept of a stratum to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

Cisco’s implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

Figure 7-1 show a typical network example using NTP. Switch A is the NTP master, with Switches B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F.
If the network is isolated from the Internet, Cisco’s implementation of NTP allows a device to act as though it is synchronized through NTP, when in fact it has determined the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

**Configuring NTP**

The switch does not have a hardware-supported clock, and it cannot function as an NTP master clock to which peers synchronize themselves when an external NTP source is not available. The switch also has no hardware support for a calendar. As a result, the **ntp update-calendar** and the **ntp master** global configuration commands are not available.

This section contains this configuration information:

- Default NTP Configuration, page 7-4
- Configuring NTP Authentication, page 7-4
- Configuring NTP Associations, page 7-5
Default NTP Configuration

Table 7-1 shows the default NTP configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>NTP authentication</td>
<td>Disabled. No authentication key is specified.</td>
</tr>
<tr>
<td>NTP peer or server associations</td>
<td>None configured.</td>
</tr>
<tr>
<td>NTP broadcast service</td>
<td>Disabled; no interface sends or receives NTP broadcast packets.</td>
</tr>
<tr>
<td>NTP access restrictions</td>
<td>No access control is specified.</td>
</tr>
<tr>
<td>NTP packet source IP address</td>
<td>The source address is determined by the outgoing interface.</td>
</tr>
</tbody>
</table>

NTP is enabled on all interfaces by default. All interfaces receive NTP packets.

Configuring NTP Authentication

This procedure must be coordinated with the administrator of the NTP server; the information you configure in this procedure must be matched by the servers used by the switch to synchronize its time to the NTP server.

Beginning in privileged EXEC mode, follow these steps to authenticate the associations (communications between devices running NTP that provide for accurate timekeeping) with other devices for security purposes:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ntp authenticate</td>
<td>Enable the NTP authentication feature, which is disabled by default.</td>
</tr>
<tr>
<td>Step 3 ntp authentication-key number md5 value</td>
<td>Define the authentication keys. By default, none are defined.</td>
</tr>
<tr>
<td></td>
<td>• For number, specify a key number. The range is 1 to 4294967295.</td>
</tr>
<tr>
<td></td>
<td>• md5 specifies that message authentication support is provided by using the message digest algorithm 5 (MD5).</td>
</tr>
<tr>
<td></td>
<td>• For value, enter an arbitrary string of up to eight characters for the key.</td>
</tr>
<tr>
<td></td>
<td>The switch does not synchronize to a device unless both have one of these authentication keys, and the key number is specified by the ntp trusted-key key-number command.</td>
</tr>
</tbody>
</table>
To disable NTP authentication, use the `no ntp authenticate` global configuration command. To remove an authentication key, use the `no ntp authentication-key number` global configuration command. To disable authentication of the identity of a device, use the `no ntp trusted-key key-number` global configuration command.

This example shows how to configure the switch to synchronize only to devices providing authentication key 42 in the device’s NTP packets:

```
Switch(config)# ntp authenticate
Switch(config)# ntp authentication-key 42 md5 aNiceKey
Switch(config)# ntp trusted-key 42
```

### Configuring NTP Associations

An NTP association can be a peer association (this switch can either synchronize to the other device or allow the other device to synchronize to it), or it can be a server association (meaning that only this switch synchronizes to the other device, and not the other way around).

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4 ntp trusted-key &lt;number&gt;</td>
<td>Specify one or more key numbers (defined in Step 3) that a peer NTP device must provide in its NTP packets for this switch to synchronize to it. By default, no trusted keys are defined. For key-number, specify the key defined in Step 3. This command provides protection against accidentally synchronizing the switch to a device that is not trusted.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable NTP authentication, use the `no ntp authenticate` global configuration command. To remove an authentication key, use the `no ntp authentication-key number` global configuration command. To disable authentication of the identity of a device, use the `no ntp trusted-key key-number` global configuration command.
Beginning in privileged EXEC mode, follow these steps to form an NTP association with another device:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>ntp peer ip-address [version number] [key keyid] [source interface] [prefer]</td>
<td>Configure the switch system clock to synchronize a peer or to be synchronized by a peer (peer association).</td>
</tr>
<tr>
<td>or</td>
<td>ntp server ip-address [version number] [key keyid] [source interface] [prefer]</td>
<td>Configure the switch system clock to be synchronized by a time server (server association).</td>
</tr>
</tbody>
</table>

No peer or server associations are defined by default.

- For *ip-address* in a peer association, specify either the IP address of the peer providing, or being provided, the clock synchronization. For a server association, specify the IP address of the time server providing the clock synchronization.
- (Optional) For *number*, specify the NTP version number. The range is 1 to 3. By default, version 3 is selected.
- (Optional) For *keyid*, enter the authentication key defined with the `ntp authentication-key` global configuration command.
- (Optional) For *interface*, specify the interface from which to pick the IP source address. By default, the source IP address is taken from the outgoing interface.
- (Optional) Enter the `prefer` keyword to make this peer or server the preferred one that provides synchronization. This keyword reduces switching back and forth between peers and servers.

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

You need to configure only one end of an association; the other device can automatically establish the association. If you are using the default NTP version (version 3) and NTP synchronization does not occur, try using NTP version 2. Many NTP servers on the Internet run version 2.

To remove a peer or server association, use the `no ntp peer ip-address` or the `no ntp server ip-address` global configuration command.

This example shows how to configure the switch to synchronize its system clock with the clock of the peer at IP address 172.16.22.44 using NTP version 2:

```
Switch(config)# ntp server 172.16.22.44 version 2
```

## Configuring NTP Broadcast Service

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP addresses of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, the information flow is one-way only.
The switch can send or receive NTP broadcast packets on an interface-by-interface basis if there is an NTP broadcast server, such as a router, broadcasting time information on the network. The switch can send NTP broadcast packets to a peer so that the peer can synchronize to it. The switch can also receive NTP broadcast packets to synchronize its own clock. This section has procedures for both sending and receiving NTP broadcast packets.

Beginning in privileged EXEC mode, follow these steps to configure the switch to send NTP broadcast packets to peers so that they can synchronize their clock to the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify the interface to send NTP broadcast packets, and enter interface configuration mode.</td>
</tr>
<tr>
<td>ntp broadcast [version number] [key keyid] [destination-address]</td>
<td>Enable the interface to send NTP broadcast packets to a peer. By default, this feature is disabled on all interfaces.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
<tr>
<td>Configure the connected peers to receive NTP broadcast packets as described in the next procedure.</td>
<td></td>
</tr>
</tbody>
</table>

To disable the interface from sending NTP broadcast packets, use the no ntp broadcast interface configuration command.

This example shows how to configure a port to send NTP version 2 packets:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ntp broadcast version 2
```

Beginning in privileged EXEC mode, follow these steps to configure the switch to receive NTP broadcast packets from connected peers:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify the interface to receive NTP broadcast packets, and enter interface configuration mode.</td>
</tr>
<tr>
<td>ntp broadcast client</td>
<td>Enable the interface to receive NTP broadcast packets. By default, no interfaces receive NTP broadcast packets.</td>
</tr>
<tr>
<td>exit</td>
<td>Return to global configuration mode.</td>
</tr>
</tbody>
</table>
Managing the System Time and Date

To disable an interface from receiving NTP broadcast packets, use the `no ntp broadcast client` interface configuration command. To change the estimated round-trip delay to the default, use the `no ntp broadcastdelay` global configuration command.

This example shows how to configure a port to receive NTP broadcast packets:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ntp broadcast client

Configuring NTP Access Restrictions

You can control NTP access on two levels as described in these sections:

- Creating an Access Group and Assigning a Basic IP Access List, page 7-8
- Disabling NTP Services on a Specific Interface, page 7-9

Creating an Access Group and Assigning a Basic IP Access List

Beginning in privileged EXEC mode, follow these steps to control access to NTP services by using access lists:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ntp access-group {query-only</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The access group keywords are scanned in this order, from least restrictive to most restrictive:

1. **peer**—Allows time requests and NTP control queries and allows the switch to synchronize itself to a device whose address passes the access list criteria.
2. **serve**—Allows time requests and NTP control queries, but does not allow the switch to synchronize itself to a device whose address passes the access list criteria.
3. **serve-only**—Allows only time requests from a device whose address passes the access list criteria.
4. **query-only**—Allows only NTP control queries from a device whose address passes the access list criteria.

If the source IP address matches the access lists for more than one access type, the first type is granted. If no access groups are specified, all access types are granted to all devices. If any access groups are specified, only the specified access types are granted.

To remove access control to the switch NTP services, use the `no ntp access-group {query-only | serve-only | serve | peer}` global configuration command.

This example shows how to configure the switch to allow itself to synchronize to a peer from access list 99. However, the switch restricts access to allow only time requests from access list 42:

```bash
Switch# configure terminal
Switch(config)# ntp access-group peer 99
Switch(config)# ntp access-group serve-only 42
Switch(config)# access-list 99 permit 172.20.130.5
Switch(config)# access-list 42 permit 172.20.130.6
```

### Disabling NTP Services on a Specific Interface

NTP services are enabled on all interfaces by default.

Beginning in privileged EXEC mode, follow these steps to disable NTP packets from being received on an interface:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>access-list access-list-number permit source [source-wildcard]</td>
<td>Create the access list.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For <strong>access-list-number</strong>, enter the number specified in Step 2.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter the <strong>permit</strong> keyword to permit access if the conditions are</td>
</tr>
<tr>
<td></td>
<td></td>
<td>matched.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For <strong>source</strong>, enter the IP address of the device that is permitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>to the switch.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For <strong>source-wildcard</strong>, enter the wildcard bits to be</td>
</tr>
<tr>
<td></td>
<td></td>
<td>applied to the source.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> When creating an access list, remember that, by default, the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>end of the access list contains an implicit deny statement for</td>
</tr>
<tr>
<td></td>
<td></td>
<td>everything if it did not find a match before reaching the end.</td>
</tr>
<tr>
<td>4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>5</td>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The access group keywords are scanned in this order, from least restrictive to most restrictive:
Managing the System Time and Date

To re-enable receipt of NTP packets on an interface, use the `no ntp disable` interface configuration command.

### Configuring the Source IP Address for NTP Packets

When the switch sends an NTP packet, the source IP address is normally set to the address of the interface through which the NTP packet is sent. Use the `ntp source` global configuration command when you want to use a particular source IP address for all NTP packets. The address is taken from the specified interface. This command is useful if the address on an interface cannot be used as the destination for reply packets.

Beginning in privileged EXEC mode, follow these steps to configure a specific interface from which the IP source address is to be taken:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter interface configuration mode, and specify the interface to disable.</td>
</tr>
<tr>
<td>Step 3 ntp disable</td>
<td>Disable NTP packets from being received on the interface.</td>
</tr>
<tr>
<td></td>
<td>By default, all interfaces receive NTP packets.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To re-enable receipt of NTP packets on an interface, use the `no ntp disable` interface configuration command.

### Displaying the NTP Configuration

You can use two privileged EXEC commands to display NTP information:

- `show ntp associations [detail]`
- `show ntp status`

For detailed information about the fields in these displays, see the Cisco IOS Configuration Fundamentals Command Reference for Cisco IOS.
Chapter 7 Administering the Switch

Managing the System Time and Date

Configuring Time and Date Manually

If no other source of time is available, you can manually configure the time and date after the system is restarted. The time remains accurate until the next system restart. We recommend that you use manual configuration only as a last resort. If you have an outside source to which the switch can synchronize, you do not need to manually set the system clock.

This section contains this configuration information:

- Setting the System Clock, page 7-11
- Displaying the Time and Date Configuration, page 7-11
- Configuring the Time Zone, page 7-12
- Configuring Summer Time (Daylight Saving Time), page 7-12

Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

Beginning in privileged EXEC mode, follow these steps to set the system clock:

1. **Step 1**
   - **Command**: `clock set hh:mm:ss [day month year]`
   - **Purpose**: Manually set the system clock using one of these formats.
     - For `hh:mm:ss`, specify the time in hours (24-hour format), minutes, and seconds. The time specified is relative to the configured time zone.
     - For `day`, specify the day by date in the month.
     - For `month`, specify the month by name.
     - For `year`, specify the year (no abbreviation).

2. **Step 2**
   - **Command**: `show running-config`
   - **Purpose**: Verify your entries.

3. **Step 3**
   - **Command**: `copy running-config startup-config`
   - **Purpose**: (Optional) Save your entries in the configuration file.

This example shows how to manually set the system clock to 1:32 p.m. on July 23, 2001:

```
Switch# clock set 13:32:00 23 July 2001
```

Displaying the Time and Date Configuration

To display the time and date configuration, use the `show clock [detail]` privileged EXEC command.

The system clock keeps an authoritative flag that shows whether the time is authoritative (believed to be accurate). If the system clock has been set by a timing source such as NTP, the flag is set. If the time is not authoritative, it is used only for display purposes. Until the clock is authoritative and the authoritative flag is set, the flag prevents peers from synchronizing to the clock when the peers’ time is invalid.

The symbol that precedes the `show clock` display has this meaning:

- *—Time is not authoritative.
- (blank)—Time is authoritative.
• Time is authoritative, but NTP is not synchronized.

### Configuring the Time Zone

Beginning in privileged EXEC mode, follow these steps to manually configure the time zone:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>clock timezone zone hours-offset [minutes-offset]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

The minutes-offset variable in the `clock timezone` global configuration command is available for those cases where a local time zone is a percentage of an hour different from UTC. For example, the time zone for some sections of Atlantic Canada (AST) is UTC-3.5, where the 3 means 3 hours and .5 means 50 percent. In this case, the necessary command is `clock timezone AST -3 30`.

To set the time to UTC, use the `no clock timezone` global configuration command.

### Configuring Summer Time (Daylight Saving Time)

Beginning in privileged EXEC mode, follow these steps to configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year:
Managing the System Time and Date

Chapter 7  Administering the Switch

The first part of the clock summer-time global configuration command specifies when summer time begins, and the second part specifies when it ends. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.

This example shows how to specify that summer time starts on the first Sunday in April at 02:00 and ends on the last Sunday in October at 02:00:

```
Switch(config)# clock summer-time PDT recurring 1 Sunday April 2:00 last Sunday October 2:00
```

Beginning in privileged EXEC mode, follow these steps if summer time in your area does not follow a recurring pattern (configure the exact date and time of the next summer time events):

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
Configuring a System Name and Prompt

You configure the system name on the switch to identify it. By default, the system name and prompt are Switch.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference for Cisco IOS Release 12.1 and the Cisco IOS IP and IP Routing Command Reference for Cisco IOS Release 12.1.

This section contains this configuration information:

- Default System Name and Prompt Configuration, page 7-15
• Configuring a System Name, page 7-15
• Understanding DNS, page 7-15

Default System Name and Prompt Configuration

The default switch system name and prompt is *Switch*.

Configuring a System Name

Beginning in privileged EXEC mode, follow these steps to manually configure a system name:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>hostname <em>name</em></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show running-config</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

When you set the system name, it is also used as the system prompt.

To return to the default hostname, use the no hostname global configuration command.

Understanding DNS

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map host names to IP addresses. When you configure DNS on your switch, you can substitute the host name for the IP address with all IP commands, such as ping, telnet, connect, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, is a commercial organization that IP identifies by a *com* domain name, so its domain name is .*com*. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as ftp..com.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the host names, specify the name server that is present on your network, and enable the DNS.

This section contains this configuration information:

• Default DNS Configuration, page 7-16
• Setting Up DNS, page 7-16
• Displaying the DNS Configuration, page 7-17
Default DNS Configuration

Table 7-2 shows the default DNS configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS enable state</td>
<td>Enabled.</td>
</tr>
<tr>
<td>DNS default domain name</td>
<td>None configured.</td>
</tr>
<tr>
<td>DNS servers</td>
<td>No name server addresses are configured.</td>
</tr>
</tbody>
</table>

Setting Up DNS

Beginning in privileged EXEC mode, follow these steps to set up your switch to use the DNS:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip domain-name name</td>
<td>Define a default domain name that the software uses to complete unqualified host names (names without a dotted-decimal domain name). Do not include the initial period that separates an unqualified name from the domain name. At boot time, no domain name is configured; however, if the switch configuration comes from a BOOTP or DHCP server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</td>
</tr>
<tr>
<td>Step 3 ip name-server server-address1 [server-address2 ... server-address6]</td>
<td>Specify the address of one or more name servers to use for name and address resolution. You can specify up to six name servers. Separate each server address with a space. The first server specified is the primary server. The switch sends DNS queries to the primary server first. If that query fails, the backup servers are queried.</td>
</tr>
<tr>
<td>Step 4 ip domain-lookup</td>
<td>(Optional) Enable DNS-based host name-to-address translation on your switch. This feature is enabled by default. If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS).</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
If you use the switch IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the `ip domain-name` global configuration command. If there is a period (.) in the hostname, the software looks up the IP address without appending any default domain name to the hostname.

To remove a domain name, use the `no ip domain-name name` global configuration command. To remove a name server address, use the `no ip name-server server-address` global configuration command. To disable DNS on the switch, use the `no ip domain-lookup` global configuration command.

**Displaying the DNS Configuration**

To display the DNS configuration information, use the `show running-config` privileged EXEC command.

**Creating a Banner**

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner displays on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner also displays on all connected terminals. It appears after the MOTD banner and before the login prompts.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>For complete syntax and usage information for the commands used in this section, see the <em>Cisco IOS Configuration Fundamentals Command Reference for Cisco IOS</em>, .</td>
</tr>
</tbody>
</table>

This section contains this configuration information:

- Default Banner Configuration, page 7-17
- Configuring a Message-of-the-Day Login Banner, page 7-17
- Configuring a Login Banner, page 7-18

**Default Banner Configuration**

The MOTD and login banners are not configured.

**Configuring a Message-of-the-Day Login Banner**

You can create a single or multiline message banner that appears on the screen when someone logs in to the switch.

Beginning in privileged EXEC mode, follow these steps to configure a MOTD login banner:
### Creating a Banner

To delete the MOTD banner, use the `no banner motd` global configuration command.

This example shows how to configure a MOTD banner for the switch by using the pound sign (`#`) symbol as the beginning and ending delimiter:

```bash
Switch(config)# banner motd #
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
#
Switch(config)#
```

This example shows the banner displayed from the previous configuration:

```
Unix> telnet 172.2.5.4
Trying 172.2.5.4...
Connected to 172.2.5.4.
Escape character is '^]'.

This is a secure site. Only authorized users are allowed.
For access, contact technical support.

User Access Verification
Password:
```

### Configuring a Login Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

Beginning in privileged EXEC mode, follow these steps to configure a login banner:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 banner motd <code>c message c</code></td>
<td>Specify the message of the day.</td>
</tr>
<tr>
<td></td>
<td>For <code>c</code>, enter the delimiting character of your choice, for example, a pound sign (<code>#</code>), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded. For <code>message</code>, enter a banner message up to 255 characters. You cannot use the delimiting character in the message.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To delete the login banner, use the `no banner login` global configuration command.

This example shows how to configure a login banner for the switch by using the dollar sign ($) symbol as the beginning and ending delimiter:

```
Switch(config)# banner login $
Access for authorized users only. Please enter your username and password. $
Switch(config)#
```

### Managing the MAC Address Table

The MAC address table contains address information that the switch uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address: a source MAC address that the switch learns and then ages when it is not in use.
- Static address: a manually entered unicast or multicast address that does not age and that is not lost when the switch resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address.

For complete syntax and usage information for the commands used in this section, see the command reference for this release.

This section contains this configuration information:

- Building the Address Table, page 7-20
- MAC Addresses and VLANs, page 7-20
- Default MAC Address Table Configuration, page 7-20
- Changing the Address Aging Time, page 7-21
- Removing Dynamic Address Entries, page 7-21
- Configuring MAC Address Notification Traps, page 7-21
Building the Address Table

With multiple MAC addresses supported on all ports, you can connect any port on the switch to individual workstations, repeaters, switches, routers, or other network devices. The switch provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As stations are added or removed from the network, the switch updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is configured on a per-switch basis. However, the switch maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The switch sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the switch forwards the packet only to the port or ports associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The switch always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

MAC Addresses and VLANs

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Multicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 11 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN. Addresses that are statically entered in one VLAN must be configured as static addresses in all other VLANs or remain unlearned in the other VLANs.

Default MAC Address Table Configuration

Table 7-3 shows the default MAC address table configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aging time</td>
<td>300 seconds</td>
</tr>
<tr>
<td>Dynamic addresses</td>
<td>Automatically learned</td>
</tr>
<tr>
<td>Static addresses</td>
<td>None configured</td>
</tr>
</tbody>
</table>
Chapter 7  Administering the Switch

Managing the MAC Address Table

Changing the Address Aging Time

Dynamic addresses are source MAC addresses that the switch learns and then ages when they are not in use. The aging time parameter defines how long the switch retains unseen addresses. This parameter applies to all VLANs.

Setting too short an aging time can cause addresses to be prematurely removed from the table. Then when the switch receives a packet for an unknown destination, it floods the packet to all ports in the same VLAN as the receiving port. This unnecessary flooding can impact performance. Setting too long an aging time can cause the address table to be filled with unused addresses, which prevents new addresses from being learned.

Beginning in privileged EXEC mode, follow these steps to configure the dynamic address table aging time:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>mac address-table aging-time [0</td>
<td>10-1000000]</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>show mac address-table aging-time</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default value, use the no mac address-table aging-time global configuration command.

Removing Dynamic Address Entries

To remove all dynamic entries, use the clear mac address-table dynamic command in privileged EXEC mode. You can also remove a specific MAC address (clear mac address-table dynamic address mac-address), remove all addresses on the specified physical port or port channel (clear mac address-table dynamic interface interface-id), or remove all addresses on a specified VLAN (clear mac address-table dynamic vlan vlan-id).

To verify that dynamic entries have been removed, use the show mac address-table dynamic privileged EXEC command.

Configuring MAC Address Notification Traps

MAC address notification enables you to track users on a network by storing the MAC address activity on the switch. Whenever the switch learns or removes a MAC address, an SNMP notification can be generated and sent to the NMS. If you have many users coming and going from the network, you can set a trap interval time to bundle the notification traps and reduce network traffic. The MAC notification history table stores the MAC address activity for each hardware port for which the trap is enabled. MAC address notifications are generated for dynamic and secure MAC addresses; events are not generated for self addresses, multicast addresses, or other static addresses.
Beginning in privileged EXEC mode, follow these steps to configure the switch to send MAC address notification traps to an NMS host:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>snmp-server host host-addr {traps</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>snmp-server enable traps mac-notification</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>mac address-table notification</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>mac address-table notification [interval value]</td>
</tr>
<tr>
<td></td>
<td>[history-size value]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>snmp trap mac-notification {added</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>end</td>
</tr>
</tbody>
</table>
Managing the MAC Address Table

To disable the switch from sending MAC address notification traps, use the `no snmp-server enable traps mac-notification` global configuration command. To disable the MAC address notification traps on a specific interface, use the `no snmp trap mac-notification {added | removed} interface` configuration command. To disable the MAC address notification feature, use the `no mac address-table notification` global configuration command.

This example shows how to specify 172.20.10.10 as the NMS, enable the switch to send MAC address notification traps to the NMS, enable the MAC address notification feature, set the interval time to 60 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port.

```
Switch(config)# snmp-server host 172.20.10.10 traps private
Switch(config)# snmp-server enable traps mac-notification
Switch(config)# mac address-table notification
Switch(config)# mac address-table notification interval 60
Switch(config)# mac address-table notification history-size 100
Switch(config)# interface fastethernet0/4
Switch(config-if)# snmp trap mac-notification added
```

You can verify the previous commands by entering the `show mac address-table notification interface` and the `show mac address-table notification` privileged EXEC commands.

### Adding and Removing Static Address Entries

A static address has these characteristics:

- It is manually entered in the address table and must be manually removed.
- It can be a unicast or multicast address.
- It does not age and is retained when the switch restarts.

You can add and remove static addresses and define the forwarding behavior for them. The forwarding behavior determines how a port that receives a packet forwards it to another port for transmission. Because all ports are associated with at least one VLAN, the switch acquires the VLAN ID for the address from the ports that you specify. You can specify a different list of destination ports for each source port.

A static address in one VLAN must be a static address in other VLANs. A packet with a static address that arrives on a VLAN where it has not been statically entered is flooded to all ports and not learned.

You add a static address to the address table by specifying the destination MAC address (unicast or multicast) and the VLAN from which it is received. Packets received with this destination address are forwarded to the interface specified with the `interface-id` option.
Beginning in privileged EXEC mode, follow these steps to add a static address:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>mac address-table static mac-addr vlan vlan-id interface interface-id</td>
</tr>
<tr>
<td></td>
<td>• For mac-addr, specify the destination MAC address (unicast or multicast) to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface.</td>
</tr>
<tr>
<td></td>
<td>• For vlan-id, specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>• For interface-id, specify the interface to which the received packet is forwarded. Valid interfaces include physical ports and port channels. For interface-id, specify the interface to which the received packet is forwarded. Valid interfaces include physical ports or port channels. For static multicast addresses, you can enter multiple interface IDs. For static unicast addresses, you can enter only one interface at a time, but you can enter the command multiple times with the same MAC address and VLAN ID.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show mac address-table static</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove static entries from the address table, use the no mac address-table static mac-addr vlan vlan-id [interface interface-id] global configuration command.

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packets is forwarded to the specified interface:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet0/1
```

**Configuring Unicast MAC Address Filtering**

When unicast MAC address filtering is enabled, the switch drops packets with specific source or destination MAC addresses. This feature is disabled by default and only supports unicast static addresses. You can enable and configure this feature only if your switch is running the EI.

Follow these guidelines when using this feature:

- Multicast MAC addresses, broadcast MAC addresses, and router MAC addresses are not supported. If you specify one of these addresses when entering the mac address-table static mac-addr vlan vlan-id drop global configuration command, one of these messages appears:

  % Only unicast addresses can be configured to be dropped

  % CPU destined address cannot be configured as drop address

- Packets that are forwarded to the CPU are also not supported.
Managing the MAC Address Table

If you add a unicast MAC address as a static address and configure unicast MAC address filtering, the switch either adds the MAC address as a static address or drops packets with that MAC address, depending on which command was entered last. The second command that you entered overrides the first command.

For example, if you enter the `mac address-table static mac-addr vlan vlan-id interface interface-id` global configuration command followed by the `mac address-table static mac-addr vlan vlan-id drop` command, the switch drops packets with the specified MAC address as a source or destination.

If you enter the `mac address-table static mac-addr vlan vlan-id drop` global configuration command followed by the `mac address-table static mac-addr vlan vlan-id interface interface-id` command, the switch adds the MAC address as a static address.

You enable unicast MAC address filtering and configure the switch to drop packets with a specific address by specifying the source or destination unicast MAC address and the VLAN from which it is received.

Beginning in privileged EXEC mode, follow these steps to configure the switch to drop a source or destination unicast static address:

1. **configure terminal**
   - Enter global configuration mode.

2. **mac address-table static mac-addr vlan vlan-id drop**
   - Enable unicast MAC address filtering and configure the switch to drop a packet with the specified source or destination unicast static address.
     - For `mac-addr`, specify a source or destination unicast MAC address. Packets with this MAC address are dropped.
     - For `vlan-id`, specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.

3. **end**
   - Return to privileged EXEC mode.

4. **show mac address-table static**
   - Verify your entries.

5. **copy running-config startup-config**
   - (Optional) Save your entries in the configuration file.

To disable unicast MAC address filtering, use the **no mac address-table static mac-addr vlan vlan-id** global configuration command.

This example shows how to enable unicast MAC address filtering and to configure the switch to drop packets that have a source or destination unicast address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
```

### Displaying Address Table Entries

You can display the MAC address table by using one or more of the privileged EXEC commands described in Table 7-4:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>mac address-table static mac-addr vlan vlan-id drop</td>
<td>Enable unicast MAC address filtering and configure the switch to drop a packet with the specified source or destination unicast static address.</td>
</tr>
<tr>
<td></td>
<td>- For <code>mac-addr</code>, specify a source or destination unicast MAC address. Packets with this MAC address are dropped.</td>
</tr>
<tr>
<td></td>
<td>- For <code>vlan-id</code>, specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show mac address-table static</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Catalyst 2950 and Catalyst 2955 Switch Software Configuration Guide

OL-10101-02
Managing the ARP Table

To communicate with a device (over Ethernet, for example), the software first must determine the 48-bit MAC or the local data link address of that device. The process of determining the local data link address from an IP address is called *address resolution*. The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Taking an IP address as input, ARP determines the associated MAC address. Once a MAC address is determined, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the *arpa* keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

For CLI procedures, see the Cisco IOS Release documentation on Cisco.com.

### Table 7-4 Commands for Displaying the MAC Address Table

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mac address-table address</td>
<td>Displays MAC address table information for the specified MAC address.</td>
</tr>
<tr>
<td>show mac address-table aging-time</td>
<td>Displays the aging time in all VLANs or the specified VLAN.</td>
</tr>
<tr>
<td>show mac address-table count</td>
<td>Displays the number of addresses present in all VLANs or the specified VLAN.</td>
</tr>
<tr>
<td>show mac address-table dynamic</td>
<td>Displays dynamic MAC address table entries only.</td>
</tr>
<tr>
<td>show mac address-table interface</td>
<td>Displays the MAC address table information for the specified interface.</td>
</tr>
<tr>
<td>show mac address-table multicast</td>
<td>Displays the Layer 2 multicast entries for all VLANs or the specified VLAN.</td>
</tr>
<tr>
<td>show mac address-table static</td>
<td>Displays static MAC address table entries only.</td>
</tr>
<tr>
<td>show mac address-table vlan</td>
<td>Displays the MAC address table information for the specified VLAN.</td>
</tr>
</tbody>
</table>
Configuring Switch-Based Authentication

This chapter describes how to configure switch-based authentication on the Catalyst 2950 or Catalyst 2955. This chapter consists of these sections:

- Preventing Unauthorized Access to Your Switch, page 8-1
- Protecting Access to Privileged EXEC Commands, page 8-2
- Controlling Switch Access with TACACS+, page 8-10
- Controlling Switch Access with RADIUS, page 8-17
- Configuring the Switch for Local Authentication and Authorization, page 8-32
- Configuring the Switch for Secure Shell, page 8-33

Preventing Unauthorized Access to Your Switch

You can prevent unauthorized users from reconfiguring your switch and viewing configuration information. Typically, you want network administrators to have access to your switch while you restrict access to users who dial from outside the network through an asynchronous port, connect from outside the network through a serial port, or connect through a terminal or workstation from within the local network.

To prevent unauthorized access into your switch, you should configure one or more of these security features:

- At a minimum, you should configure passwords and privileges at each switch port. These passwords are locally stored on the switch. When users attempt to access the switch through a port or line, they must enter the password specified for the port or line before they can access the switch. For more information, see the “Protecting Access to Privileged EXEC Commands” section on page 8-2.

- For an additional layer of security, you can also configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or interfaces and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair. For more information, see the “Configuring Username and Password Pairs” section on page 8-7.

- If you want to use username and password pairs, but you want to store them centrally on a server instead of locally, you can store them in a database on a security server. Multiple networking devices can then use the same database to obtain user authentication (and, if necessary, authorization) information. For more information, see the “Controlling Switch Access with TACACS+” section on page 8-10.
Protecting Access to Privileged EXEC Commands

A simple way of providing terminal access control in your network is to use passwords and assign privilege levels. Password protection restricts access to a network or network device. Privilege levels define what commands users can enter after they have logged into a network device.

Note
For complete syntax and usage information for the commands used in this section, see the Cisco IOS Security Command Reference for Cisco IOS Release 12.

This section describes how to control access to the configuration file and privileged EXEC commands. It contains this configuration information:

- Default Password and Privilege Level Configuration, page 8-2
- Setting or Changing a Static Enable Password, page 8-3
- Protecting Enable and Enable Secret Passwords with Encryption, page 8-4
- Disabling Password Recovery, page 8-5
- Setting a Telnet Password for a Terminal Line, page 8-6
- Configuring Username and Password Pairs, page 8-7
- Configuring Multiple Privilege Levels, page 8-8

Default Password and Privilege Level Configuration

Table 8-1 shows the default password and privilege level configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is not encrypted in the configuration file.</td>
</tr>
<tr>
<td>Enable secret password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is encrypted before it is written to the configuration file.</td>
</tr>
<tr>
<td>Line password</td>
<td>No password is defined.</td>
</tr>
</tbody>
</table>

Table 8-1 Default Password and Privilege Levels
Setting or Changing a Static Enable Password

The enable password controls access to the privileged EXEC mode. Beginning in privileged EXEC mode, follow these steps to set or change a static enable password:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 enable password <strong>password</strong></td>
<td>Define a new password or change an existing password for access to privileged EXEC mode. By default, no password is defined. For <strong>password</strong>, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. It can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password abc?123, do this: Enter <strong>abc</strong>. Enter Ctrl-v. Enter ?123. When the system prompts you to enter the enable password, you need not precede the question mark with the Ctrl-v; you can simply enter abc?123 at the password prompt.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file. The enable password is not encrypted and can be read in the switch configuration file.</td>
</tr>
</tbody>
</table>

To remove the password, use the **no enable password** global configuration command.

This example shows how to change the enable password to 1lu2c3k4y5. The password is not encrypted and provides access to level 15 (traditional privileged EXEC mode access):

```
Switch(config)# enable password 1lu2c3k4y5
```
Protecting Enable and Enable Secret Passwords with Encryption

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a TFTP server, you can use either the `enable password` or `enable secret` global configuration commands. Both commands accomplish the same thing; that is, you can establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify.

We recommend that you use the `enable secret` command because it uses an improved encryption algorithm.

If you configure the `enable secret` command, it takes precedence over the `enable password` command; the two commands cannot be in effect simultaneously.

Beginning in privileged EXEC mode, follow these steps to configure encryption for enable and enable secret passwords:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
</tbody>
</table>
| Step 2 | `enable password [level level] {password | encryption-type encrypted-password}` or `enable secret [level level] {password | encryption-type encrypted-password}` | Define a new password or change an existing password for access to privileged EXEC mode. or Define a secret password, which is saved using a nonreversible encryption method.  
  - (Optional) For `level`, the range is from 0 to 15. Level 1 is normal user EXEC mode privileges. The default level is 15 (privileged EXEC mode privileges).  
  - For `password`, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.  
  - (Optional) For `encryption-type`, only type 5, a Cisco proprietary encryption algorithm, is available. If you specify an encryption type, you must provide an encrypted password—an encrypted password you copy from another 2950 configuration.  
  Note: If you specify an encryption type and then enter a clear text password, you cannot re-enter privileged EXEC mode. You cannot recover a lost encrypted password by any method. |
| Step 3 | `service password-encryption` | (Optional) Encrypt the password when the password is defined or when the configuration is written. Encryption prevents the password from being readable in the configuration file. |
| Step 4 | `end` | Return to privileged EXEC mode. |
| Step 5 | `copy running-config startup-config` | (Optional) Save your entries in the configuration file. |

If both the enable and enable secret passwords are defined, users must enter the enable secret password.
Use the **level** keyword to define a password for a specific privilege level. After you specify the level and set a password, give the password only to users who need to have access at this level. Use the **privilege level** global configuration command to specify commands accessible at various levels. For more information, see the “Configuring Multiple Privilege Levels” section on page 8-8.

If you enable password encryption, it applies to all passwords including username passwords, authentication key passwords, the privileged command password, and virtual terminal line passwords.

To remove a password and level, use the **no enable password [level level]** or **no enable secret [level level]** global configuration command. To disable password encryption, use the **no service password-encryption** global configuration command.

This example shows how to configure the encrypted password $1$FaD0$Xyti5Rkl$3LoyxzS8 for privilege level 2:

```
Switch(config)# enable secret level 2 5 $1$FaD0$Xyti5Rkl$3LoyxzS8
```

### Disabling Password Recovery

By default, any end user with physical access to the Catalyst 2950 Long-Reach Ethernet (LRE) switch can recover from a lost password by interrupting the boot process while the switch is powering on and then by entering a new password.

The password-recovery disable feature protects access to the switch password by disabling part of this functionality. When this feature is enabled, the end user can interrupt the boot process only by agreeing to set the system back to the default configuration. With password recovery disabled, you can still interrupt the boot process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted.

**Note**

The password recovery disable feature is available only on Catalyst 2950 LRE switches; it is not available for non-LRE Catalyst 2950 switches or for Catalyst 2955 switches.

**Note**

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol. For more information, see the “Recovering from Lost or Forgotten Passwords on Non-LRE Catalyst 2950 Switches” section on page 31-2, the “Recovering from Lost or Forgotten Passwords on Catalyst 2950 LRE Switches” section on page 31-4, and the “Recovering from Lost or Forgotten Passwords on Catalyst 2955 Switches” section on page 31-7.
Protecting Access to Privileged EXEC Commands

Beginning in privileged EXEC mode, follow these steps to disable password recovery:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: no service password-recovery</td>
<td>Disable password recovery. This setting is saved in an area of the flash memory that is accessible by the boot loader and the software image, but it is not part of the file system and is not accessible by any user.</td>
</tr>
<tr>
<td>Step 3: end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4: show version</td>
<td>Verify the configuration by checking the last few lines of the display.</td>
</tr>
</tbody>
</table>

To re-enable password recovery, use the `service password-recovery` global configuration command.

**Note** Disabling password recovery will not work if you have set the switch to boot manually by using the `boot manual` global configuration command. This command produces the boot loader prompt (switch:) after the switch is power cycled.

Setting a Telnet Password for a Terminal Line

When you power-up your switch for the first time, an automatic setup program runs to assign IP information and to create a default configuration for continued use. The setup program also prompts you to configure your switch for Telnet access through a password. If you neglected to configure this password during the setup program, you can configure it now through the command-line interface (CLI).

Beginning in privileged EXEC mode, follow these steps to configure your switch for Telnet access:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: attach a PC or workstation with emulation software to the switch console port. The default data characteristics of the console port are 9600, 8, 1, no parity. You might need to press the Return key several times to see the command-line prompt.</td>
<td></td>
</tr>
<tr>
<td>Step 2: enable password password</td>
<td>Enter privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 3: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 4: line vty 0 15</td>
<td>Configure the number of Telnet sessions (lines), and enter line configuration mode. There are 16 possible sessions on a command-capable switch. The 0 and 15 mean that you are configuring all 16 possible Telnet sessions.</td>
</tr>
<tr>
<td>Step 5: password password</td>
<td>Enter a Telnet password for the line or lines. For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</td>
</tr>
<tr>
<td>Step 6: end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Chapter 8  Configuring Switch-Based Authentication

Protecting Access to Privileged EXEC Commands

To remove the password, use the no password global configuration command.

This example shows how to set the Telnet password to let45me67in89:

Switch(config)# line vty 10
Switch(config-line)# password let45me67in89

Configuring Username and Password Pairs

You can configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or interfaces and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

Beginning in privileged EXEC mode, follow these steps to establish a username-based authentication system that requests a login username and a password:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>username name [privilege level] [password encryption-type password]</td>
<td>Enter the username, privilege level, and password for each user.</td>
</tr>
<tr>
<td></td>
<td>• For name, specify the user ID as one word. Spaces and quotation marks are not allowed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• (Optional) For level, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 1 gives user EXEC mode access.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• For encryption-type, enter 0 to specify that an unencrypted password will follow. Enter 7 to specify that a hidden password will follow.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• For password, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the username command.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>line console 0 or line vty 0 15</td>
<td>Enter line configuration mode, and configure the console port (line 0) or the VTY lines (line 0 to 15).</td>
</tr>
<tr>
<td>4</td>
<td>login local</td>
<td>Enable local password checking at login time. Authentication is based on the username specified in Step 2.</td>
</tr>
<tr>
<td>5</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>6</td>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>7</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To disable username authentication for a specific user, use the `no username name` global configuration command. To disable password checking and allow connections without a password, use the `no login` line configuration command.

### Configuring Multiple Privilege Levels

By default, the software has two modes of password security: user EXEC and privileged EXEC. You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

For example, if you want many users to have access to the `clear line` command, you can assign it level 2 security and distribute the level 2 password fairly widely. But if you want more restricted access to the `configure` command, you can assign it level 3 security and distribute that password to a more restricted group of users.

This section includes this configuration information:
- Setting the Privilege Level for a Command, page 8-8
- Changing the Default Privilege Level for Lines, page 8-9
- Logging into and Exiting a Privilege Level, page 8-10

### Setting the Privilege Level for a Command

Beginning in privileged EXEC mode, follow these steps to set the privilege level for a command mode:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>privilege mode level level command</td>
<td>Set the privilege level for a command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- For <code>mode</code>, enter <code>configure</code> for global configuration mode, <code>exec</code> for EXEC mode, <code>interface</code> for interface configuration mode, or <code>line</code> for line configuration mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- For <code>level</code>, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges. Level 15 is the level of access permitted by the <code>enable</code> password.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- For <code>command</code>, specify the command to which you want to restrict access.</td>
</tr>
<tr>
<td>3</td>
<td>enable password level level password</td>
<td>Specify the enable password for the privilege level.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- For <code>level</code>, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- For <code>password</code>, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</td>
</tr>
<tr>
<td>4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Protecting Access to Privileged EXEC Commands

When you set a command to a privilege level, all commands whose syntax is a subset of that command are also set to that level. For example, if you set the `show ip traffic` command to level 15, the `show` commands and `show ip` commands are automatically set to privilege level 15 unless you set them individually to different levels.

To return to the default privilege for a given command, use the `no privilege mode level level` global configuration command.

This example shows how to set the `configure` command to privilege level 14 and define `SecretPswd14` as the password users must enter to use level 14 commands:

```
Switch(config)# privilege exec level 14 configure
Switch(config)# enable password level 14 SecretPswd14
```

### Changing the Default Privilege Level for Lines

Beginning in privileged EXEC mode, follow these steps to change the default privilege level for a line:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>line vty line</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>privilege level level</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>end</code></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>show running-config</code></td>
</tr>
<tr>
<td>or</td>
<td><code>show privilege</code></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

Users can override the privilege level you set using the `privilege level line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the `disable` command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

To return to the default line privilege level, use the `no privilege level` line configuration command.
Logging into and Exiting a Privilege Level

Beginning in privileged EXEC mode, follow these steps to log in to a specified privilege level and to exit to a specified privilege level:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable level</td>
<td>Log in to a specified privilege level. For level, the range is 0 to 15.</td>
</tr>
<tr>
<td>disable level</td>
<td>Exit to a specified privilege level. For level, the range is 0 to 15.</td>
</tr>
</tbody>
</table>

Controlling Switch Access with TACACS+

This section describes how to enable and configure TACACS+, which provides detailed accounting information and flexible administrative control over authentication and authorization processes. TACACS+ is facilitated through authentication, authorization, accounting (AAA) and can be enabled only through AAA commands.

Note

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Security Command Reference for Cisco IOS Release 12.

This section contains this configuration information:
- Understanding TACACS+, page 8-10
- TACACS+ Operation, page 8-12
- Configuring TACACS+, page 8-12
- Displaying the TACACS+ Configuration, page 8-17

Understanding TACACS+

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch. TACACS+ services are maintained in a database on a TACACS+ daemon typically running on a UNIX or Windows NT workstation. You should have access to and should configure a TACACS+ server before the configuring TACACS+ features on your switch.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—independently. Each service can be tied into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.

The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers. A network access server provides connections to a single user, to a network or subnetwork, and to interconnected networks as shown in Figure 8-1.
TACACS+, administered through the AAA security services, can provide these services:

- **Authentication**—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.
  
The authentication facility can conduct a dialog with the user (for example, after a username and password are provided, to challenge a user with several questions, such as home address, mother’s maiden name, service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company’s password aging policy.

- **Authorization**—Provides fine-grained control over user capabilities for the duration of the user’s session, including but not limited to setting autocommands, access control, session duration, or protocol support. You can also enforce restrictions on what commands a user can execute with the TACACS+ authorization feature.

- **Accounting**—Collects and sends information used for billing, auditing, and reporting to the TACACS+ daemon. Network managers can use the accounting facility to track user activity for a security audit or to provide information for user billing. Accounting records include user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

You need a system running the TACACS+ daemon software to use TACACS+ on your switch.
TACACS+ Operation

When a user attempts a simple ASCII login by authenticating to a switch by using TACACS+, this process occurs:

1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt to show to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.
   TACACS+ allows a dialog between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items, such as the user’s mother’s maiden name.

2. The switch eventually receives one of these responses from the TACACS+ daemon:
   - ACCEPT—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.
   - REJECT—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.
   - ERROR—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.
   - CONTINUE—The user is prompted for additional authentication information.

After authentication, the user undergoes an additional authorization phase if authorization has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

3. If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user, determining the services that the user can access:
   - Telnet, Secure Shell (SSH), rlogin, or privileged EXEC services
   - Connection parameters, including the host or client IP address, access list, and user timeouts

Configuring TACACS+

This section describes how to configure your switch to support TACACS+. At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the method lists for TACACS+ authentication. You can optionally define method lists for TACACS+ authorization and accounting. A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used, thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

This section contains this configuration information:

- Default TACACS+ Configuration, page 8-13
- Identifying the TACACS+ Server Host and Setting the Authentication Key, page 8-13
- Configuring TACACS+ Login Authentication, page 8-14
Default TACACS+ Configuration

TACACS+ and AAA are disabled by default.

To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

Note

Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

Identifying the TACACS+ Server Host and Setting the Authentication Key

You can configure the switch to use a single server or AAA server groups to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contains the list of IP addresses of the selected server hosts.

Beginning in privileged EXEC mode, follow these steps to identify the IP host or host maintaining TACACS+ server and optionally set the encryption key:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>tacacs-server host hostname [port integer] [timeout integer] [key string]</td>
<td>Identify the IP host or hosts maintaining a TACACS+ server. Enter this command multiple times to create a list of preferred hosts. The software searches for hosts in the order in which you specify them.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For hostname, specify the name or IP address of the host.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For port integer, specify a server port number. The default is port 49. The range is 1 to 65535.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For timeout integer, specify a time in seconds the switch waits for a response from the daemon before it times out and declares an error. The default is 5 seconds. The range is 1 to 1000 seconds.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For key string, specify the encryption key for encrypting and decrypting all traffic between the switch and the TACACS+ daemon. You must configure the same key on the TACACS+ daemon for encryption to be successful.</td>
</tr>
<tr>
<td>3</td>
<td>aaa new-model</td>
<td>Enable AAA.</td>
</tr>
<tr>
<td>4</td>
<td>aaa group server tacacs+ group-name</td>
<td>(Optional) Define the AAA server-group with a group name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This command puts the switch in a server group subconfiguration mode.</td>
</tr>
<tr>
<td>5</td>
<td>server ip-address</td>
<td>(Optional) Associate a particular TACACS+ server with the defined server group. Repeat this step for each TACACS+ server in the AAA server group.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Each server in the group must be previously defined in Step 2.</td>
</tr>
</tbody>
</table>
To remove the specified TACACS+ server name or address, use the `no tacacs-server host hostname` global configuration command. To remove a server group from the configuration list, use the `no aaa group server tacacs+ group-name` global configuration command. To remove the IP address of a TACACS+ server, use the `no server ip-address` server group subconfiguration command.

**Configuring TACACS+ Login Authentication**

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various interfaces. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific interface before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named `default`). The default method list is automatically applied to all interfaces except those that have a named method list explicitly defined. A defined method list overrides the default method list.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

Beginning in privileged EXEC mode, follow these steps to configure login authentication:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 aaa new-model</td>
<td>Enable AAA.</td>
</tr>
</tbody>
</table>

(Optional) Save your entries in the configuration file.
To disable AAA, use the **no aaa new-model** global configuration command. To disable AAA authentication, use the **no aaa authentication login {default | list-name} method1 [method2...]** global configuration command. To either disable TACACS+ authentication for logins or to return to the default value, use the **no login authentication {default | list-name}** line configuration command.
Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is located either in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

You can use the `aaa authorization` global configuration command with the `tacacs+` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The `aaa authorization exec tacacs+ local` command sets these authorization parameters:

- Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.
- Use the local database if authentication was not performed by using TACACS+.

**Note**

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Beginning in privileged EXEC mode, follow these steps to specify TACACS+ authorization for privileged EXEC access and network services:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>aaa authorization network tacacs+</code> Configure the switch for user TACACS+ authorization for all network-related service requests.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>aaa authorization exec tacacs+</code> Configure the switch for user TACACS+ authorization to determine if the user has privileged EXEC access. The <code>exec</code> keyword might return user profile information (such as <code>autocommand</code> information).</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show running-config</code> Verify your entries.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable authorization, use the `no aaa authorization {network | exec} method1` global configuration command.

Starting TACACS+ Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.
Beginning in privileged EXEC mode, follow these steps to enable TACACS+ accounting for each privilege level and for network services:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>aaa accounting network start-stop tacacs+</td>
<td>Enable TACACS+ accounting for all network-related service requests.</td>
</tr>
<tr>
<td>aaa accounting exec start-stop tacacs+</td>
<td>Enable TACACS+ accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable accounting, use the `no aaa accounting {network | exec} {start-stop} method1...` global configuration command.

### Displaying the TACACS+ Configuration

To display TACACS+ server statistics, use the `show tacacs` privileged EXEC command.

### Controlling Switch Access with RADIUS

This section describes how to enable and configure the RADIUS, which provides detailed accounting information and flexible administrative control over authentication and authorization processes. RADIUS is facilitated through AAA and can be enabled only through AAA commands.

For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Security Command Reference for Cisco IOS Release 12*.

This section contains this configuration information:

- Understanding RADIUS, page 8-17
- RADIUS Operation, page 8-19
- Configuring RADIUS, page 8-19
- Displaying the RADIUS Configuration, page 8-31

### Understanding RADIUS

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information.
The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors’ access servers, dial-in users are authenticated through a RADIUS server that has been customized to work with the Kerberos security system.

- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a smart card access control system. In one case, RADIUS has been used with Enigma’s security cards to validate users and to grant access to network resources.

- Networks already using RADIUS. You can add a Cisco switch containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 8-2 on page 8-19.

- Network in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1X. For more information about this protocol, see Chapter 9, “Configuring IEEE 802.1x Port-Based Authentication.”

- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.

RADIUS is not suitable in these network security situations:

- Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.

- Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.

- Networks using a variety of services. RADIUS generally binds a user to one service model.
RADIUS Operation

When a user attempts to log in and authenticate to a switch that is access controlled by a RADIUS server, these events occur:

1. The user is prompted to enter a username and password.
2. The username and encrypted password are sent over the network to the RADIUS server.
3. The user receives one of these responses from the RADIUS server:
   a. ACCEPT—The user is authenticated.
   b. REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
   c. CHALLENGE—A challenge requires additional data from the user.
   d. CHALLENGE PASSWORD—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts

Configuring RADIUS

This section describes how to configure your switch to support RADIUS. At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.
A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used (such as TACACS+ or local username lookup), thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

You should have access to and should configure a RADIUS server before configuring RADIUS features on your switch.

This section contains this configuration information:

- Default RADIUS Configuration, page 8-20
- Identifying the RADIUS Server Host, page 8-20 (required)
- Configuring RADIUS Login Authentication, page 8-23 (required)
- Defining AAA Server Groups, page 8-25 (optional)
- Configuring RADIUS Authorization for User Privileged Access and Network Services, page 8-27 (optional)
- Starting RADIUS Accounting, page 8-28 (optional)
- Configuring Settings for All RADIUS Servers, page 8-28 (optional)
- Configuring the Switch to Use Vendor-Specific RADIUS Attributes, page 8-29 (optional)
- Configuring the Switch for Vendor-Proprietary RADIUS Server Communication, page 8-30 (optional)

**Default RADIUS Configuration**

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch through the CLI.

**Identifying the RADIUS Server Host**

Switch-to-RADIUS-server communication involves several components:

- Host name or IP address
- Authentication destination port
- Accounting destination port
- Key string
- Timeout period
- Retransmission value

You identify RADIUS security servers by their host name or IP address, host name and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.
If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the switch tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings. To apply these settings globally to all RADIUS servers communicating with the switch, use the three unique global configuration commands: `radius-server timeout`, `radius-server retransmit`, and `radius-server key`. To apply these values on a specific RADIUS server, use the `radius-server host` global configuration command.

**Note**

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the switch, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands. For information on configuring these settings on all RADIUS servers, see the “Configuring Settings for All RADIUS Servers” section on page 8-28.

You can configure the switch to use AAA server groups to group existing server hosts for authentication. For more information, see the “Defining AAA Server Groups” section on page 8-25.
Beginning in privileged EXEC mode, follow these steps to configure per-server RADIUS server communication. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>radius-server host ({hostname \mid ip-address}) [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show running-config</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove the specified RADIUS server, use the no radius-server host hostname \(\mid ip-address\) global configuration command.

This example shows how to configure one RADIUS server to be used for authentication and another to be used for accounting:

```
Switch(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1
Switch(config)# radius-server host 172.20.36.50 acct-port 1618 key rad2
```
This example shows how to configure host1 as the RADIUS server and to use the default ports for both authentication and accounting:

```
Switch(config)# radius-server host host1
```

**Note**
You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

## Configuring RADIUS Login Authentication

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various interfaces. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific interface before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named `default`). The default method list is automatically applied to all interfaces except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

Beginning in privileged EXEC mode, follow these steps to configure login authentication. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>aaa new-model</td>
<td>Enable AAA.</td>
</tr>
</tbody>
</table>
### Controlling Switch Access with RADIUS

#### Chapter 8  Configuring Switch-Based Authentication

#### Step 3

**Command**

```
aaa authentication login [default | list-name] method1 [method2...]
```

**Purpose**

Create a login authentication method list.

- To create a default list that is used when a named list is not specified in the `login authentication` command, use the `default` keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all interfaces.
- For `list-name`, specify a character string to name the list you are creating.
- For `method1...`, specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.

Select one of these methods:

- **enable**—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the `enable password` global configuration command.
- **group radius**—Use RADIUS authentication. Before you can use this authentication method, you must configure the RADIUS server. For more information, see the “Identifying the RADIUS Server Host” section on page 8-20.
- **line**—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the `password password` line configuration command.
- **local**—Use the local username database for authentication. You must enter username information in the database. Use the `username name password` global configuration command.
- **local-case**—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the `username password` global configuration command.
- **none**—Do not use any authentication for login.

#### Step 4

**Command**

```
line [console | tty | vty] line-number [ending-line-number]
```

**Purpose**

Enter line configuration mode, and configure the lines to which you want to apply the authentication list.

#### Step 5

**Command**

```
login authentication [default | list-name]
```

**Purpose**

Apply the authentication list to a line or set of lines.

- If you specify `default`, use the default list created with the `aaa authentication login` command.
- For `list-name`, specify the list created with the `aaa authentication login` command.

#### Step 6

**Command**

```
end
```

**Purpose**

Return to privileged EXEC mode.

#### Step 7

**Command**

```
show running-config
```

**Purpose**

Verify your entries.

#### Step 8

**Command**

```
copy running-config startup-config
```

**Purpose**

(Optional) Save your entries in the configuration file.
To disable AAA, use the **no aaa new-model** global configuration command. To disable AAA authentication, use the **no aaa authentication login [default | list-name] method1 [method2...]** global configuration command. To either disable RADIUS authentication for logins or to return to the default value, use the **no login authentication [default | list-name]** line configuration command.

### Defining AAA Server Groups

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a fail-over backup to the first one.

You use the **server** group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional **auth-port** and **acct-port** keywords.
Beginning in privileged EXEC mode, follow these steps to define the AAA server group and associate a particular RADIUS server with it:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;radius-server host [hostname</td>
<td>Specify the IP address or host name of the remote RADIUS server host.</td>
</tr>
<tr>
<td>ip-address] [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]</td>
<td></td>
</tr>
<tr>
<td></td>
<td><em>(Optional)</em> For <strong>auth-port</strong> port-number, specify the UDP destination port for authentication requests.</td>
</tr>
<tr>
<td></td>
<td><em>(Optional)</em> For <strong>acct-port</strong> port-number, specify the UDP destination port for accounting requests.</td>
</tr>
<tr>
<td></td>
<td><em>(Optional)</em> For <strong>timeout</strong> seconds, specify the time interval that the switch waits for the RADIUS server to reply before resending. The range is 1 to 1000. This setting overrides the <strong>radius-server timeout</strong> global configuration command setting. If no timeout is set with the <strong>radius-server host</strong> command, the setting of the <strong>radius-server timeout</strong> command is used.</td>
</tr>
<tr>
<td></td>
<td><em>(Optional)</em> For <strong>retransmit</strong> retries, specify the number of times a RADIUS request is resent to a server if that server is not responding or responding slowly. The range is 1 to 1000. If no retransmit value is set with the <strong>radius-server host</strong> command, the setting of the <strong>radius-server retransmit</strong> global configuration command is used.</td>
</tr>
<tr>
<td></td>
<td><em>(Optional)</em> For <strong>key</strong> string, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the <strong>radius-server host</strong> command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
<tr>
<td><strong>Step 3</strong>&lt;br&gt;aaa new-model</td>
<td>Enable AAA.</td>
</tr>
<tr>
<td><strong>Step 4</strong>&lt;br&gt;aaa group server radius group-name</td>
<td>Define the AAA server-group with a group name.</td>
</tr>
<tr>
<td></td>
<td>This command puts the switch in a server group configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong>&lt;br&gt;server ip-address</td>
<td>Associate a particular RADIUS server with the defined server group.</td>
</tr>
<tr>
<td></td>
<td>Repeat this step for each RADIUS server in the AAA server group.</td>
</tr>
<tr>
<td></td>
<td>Each server in the group must be previously defined in Step 2.</td>
</tr>
<tr>
<td><strong>Step 6</strong>&lt;br&gt;end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong>&lt;br&gt;show running-config</td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>
To remove the specified RADIUS server, use the `no radius-server host hostname | ip-address` global configuration command. To remove a server group from the configuration list, use the `no aaa group server radius group-name` global configuration command. To remove the IP address of a RADIUS server, use the `no server ip-address` server group configuration command.

In this example, the switch is configured to recognize two different RADIUS group servers (`group1` and `group2`). Group1 has two different host entries on the same RADIUS server configured for the same services. The second host entry acts as a fail-over backup to the first entry.

```bash
Switch(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646
Switch(config)# aaa new-model
Switch(config)# aaa group server radius group1
Switch(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config-sg-radius)# exit
Switch(config)# aaa group server radius group2
Switch(config-sg-radius)# server 172.20.0.1 auth-port 2000 acct-port 2001
Switch(config-sg-radius)# exit
```

### Configuring RADIUS Authorization for User Privileged Access and Network Services

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

You can use the `aaa authorization global configuration command with the radius keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The `aaa authorization exec radius local` command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.

**Note**

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Beginning in privileged EXEC mode, follow these steps to specify RADIUS authorization for privileged EXEC access and network services:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>aaa authorization network radius</td>
<td>Configure the switch for user RADIUS authorization for all network-related service requests.</td>
</tr>
</tbody>
</table>
Controlling Switch Access with RADIUS

Chapter 8  Configuring Switch-Based Authentication

To disable authorization, use the `no aaa authorization {network | exec} method1` global configuration command.

Starting RADIUS Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

Beginning in privileged EXEC mode, follow these steps to enable RADIUS accounting for each Cisco IOS privilege level and for network services:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td><code>aaa authorization exec radius</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show running-config</code></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

To disable accounting, use the `no aaa accounting {network | exec} {start-stop} method1...` global configuration command.

Configuring Settings for All RADIUS Servers

Beginning in privileged EXEC mode, follow these steps to configure global communication settings between the switch and all RADIUS servers:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>aaa accounting network start-stop radius</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>aaa accounting exec start-stop radius</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show running-config</code></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

To disable accounting, use the `no aaa accounting {network | exec} {start-stop} method1...` global configuration command.
To return to the default setting for the retransmit, timeout, and deadtime, use the `no` forms of these commands.

### Configuring the Switch to Use Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco’s vendor-ID is 9, and the supported option has vendor-type 1, which is named `cisco-avpair`. The value is a string with this format:

```
protocol : attribute sep value *
```

*Protocol* is a value of the Cisco protocol attribute for a particular type of authorization. *Attribute* and *value* are an appropriate attribute-value (AV) pair defined in the Cisco TACACS+ specification, and *sep* is = for mandatory attributes and is * for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

For example, this AV pair activates Cisco’s *multiple named ip address pools* feature during IP authorization (during PPP’s IPCP address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

This example shows how to provide a user logging in from a switch with immediate access to privileged EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```
This example shows how to specify an authorized VLAN in the RADIUS server database:

```
cisco-avpair= "tunnel-type(#64)=VLAN(13)"
cisco-avpair= "tunnel-medium-type(#65)=802 media(6)"
cisco-avpair= "tunnel-private-group-ID(#81)=vlanid"
```

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, “Remote Authentication Dial-In User Service (RADIUS).”

Beginning in privileged EXEC mode, follow these steps to configure the switch to recognize and use VSAs:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>radius-server vsa send [accounting</td>
</tr>
<tr>
<td></td>
<td>authentication]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

For a complete list of RADIUS attributes or more information about vendor-specific attribute 26, see the “RADIUS Attributes” appendix in the Cisco IOS Security Configuration Guide for Cisco IOS Release 12.

### Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.

As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the `radius-server` global configuration commands.

Beginning in privileged EXEC mode, follow these steps to specify a vendor-proprietary RADIUS server host and a shared secret text string:
To delete the vendor-proprietary RADIUS host, use the `no radius-server host {hostname \| ip-address} non-standard` global configuration command. To disable the key, use the `no radius-server key` global configuration command.

This example shows how to specify a vendor-proprietary RADIUS host and to use a secret key of `rad124` between the switch and the server:

```
Switch(config)# radius-server host 172.20.30.15 nonstandard
Switch(config)# radius-server key rad124
```

**Displaying the RADIUS Configuration**

To display the RADIUS configuration, use the `show running-config` privileged EXEC command.
Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Beginning in privileged EXEC mode, follow these steps to configure the switch for local AAA:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>aaa new-model</td>
</tr>
<tr>
<td>Step 3</td>
<td>aaa authentication login default local</td>
</tr>
<tr>
<td>Step 4</td>
<td>aaa authorization exec local</td>
</tr>
<tr>
<td>Step 5</td>
<td>aaa authorization network local</td>
</tr>
<tr>
<td>Step 6</td>
<td>username name [privilege level] {password encryption-type password}</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td>end</td>
</tr>
<tr>
<td>Step 8</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 9</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable AAA, use the no aaa new-model global configuration command. To disable authorization, use the no aaa authorization [network | exec] method1 global configuration command.
Configuring the Switch for Secure Shell

This section describes how to configure the Secure Shell (SSH) feature. SSH is a cryptographic security feature that is subject to export restrictions. To use this feature, the cryptographic (encrypted) software image must be installed on your switch. You must obtain authorization to use this feature and to download the cryptographic software files from cisco.com. For more information, see the release notes for this release.

This section contains this information:

- Understanding SSH, page 8-33
- Configuring SSH, page 8-34
- Displaying the SSH Configuration and Status, page 8-37

For SSH configuration examples, see the “SSH Configuration Examples” section in the “Configuring Secure Shell” chapter of the Cisco IOS Security Configuration Guide, Cisco IOS Release 12.2, at this URL:

Note

For complete syntax and usage information for the commands used in this section, see the command reference for this release and the Cisco IOS Commands Master List, Release 12.2 at this URL:

Understanding SSH

SSH is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH version 1 (SSHv1) and SSH version 2 (SSHv2).

This section consists of these topics:

- SSH Servers, Integrated Clients, and Supported Versions, page 8-33
- Limitations, page 8-34

SSH Servers, Integrated Clients, and Supported Versions

The SSH feature has an SSH server and an SSH integrated client, which are applications that run on the switch. You can use an SSH client to connect to a switch running the SSH server. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client also works with the SSH server supported in this release and with non-Cisco SSH servers.

The switch supports an SSHv1 or an SSHv2 server.

The switch supports an SSHv1 client.

SSH supports the Data Encryption Standard (DES) encryption algorithm, the Triple DES (3DES) encryption algorithm, and password-based user authentication.

SSH also supports these user authentication methods:
• TACACS+ (for more information, see the “Controlling Switch Access with TACACS+” section on page 8-10)
• RADIUS (for more information, see the “Controlling Switch Access with RADIUS” section on page 8-17)
• Local authentication and authorization (for more information, see the “Configuring the Switch for Local Authentication and Authorization” section on page 8-32)

Note
This software release does not support IP Security (IPSec).

Limitations

These limitations apply to SSH:
• The switch supports Rivest, Shamir, and Adelman (RSA) authentication.
• SSH supports only the execution-shell application.
• The SSH server and the SSH client are supported only on DES (56-bit) and 3DES (168-bit) data encryption software.
• The switch does not support the Advanced Encryption Standard (AES) symmetric encryption algorithm.

Configuring SSH

This section has this configuration information:
• Configuration Guidelines, page 8-34
• Cryptographic Software Image Guidelines, page 8-35
• Setting Up the Switch to Run SSH, page 8-35 (required)
• Configuring the SSH Server, page 8-36 (required only if you are configuring the switch as an SSH server)

Configuration Guidelines

Follow these guidelines when configuring the switch as an SSH server or SSH client:
• An RSA key pair generated by a SSHv1 server can be used by an SSHv2 server, and the reverse.
• If you get CLI error messages after entering the `crypto key generate rsa` global configuration command, an RSA key pair has not been generated. Reconfigure the host name and domain, and then enter the `crypto key generate rsa` command. For more information, see the “Setting Up the Switch to Run SSH” section on page 8-35.
• When generating the RSA key pair, the message “No host name specified” might appear. If it does, you must configure a host name by using the `hostname` global configuration command.
• When generating the RSA key pair, the message “No domain specified” might appear. If it does, you must configure an IP domain name by using the `ip domain-name` global configuration command.
• When configuring the local authentication and authorization authentication method, make sure that AAA is disabled on the console.
### Cryptographic Software Image Guidelines

These guidelines apply only to non-LRE Catalyst 2950 and 2940 switches:

The SSH feature uses a large amount of switch memory, which limits the number of VLANs, trunk ports, and cluster members that you can configure on the switch. Before you download the cryptographic software image, your switch configuration must meet these conditions:

- The number of trunk ports multiplied by the number of VLANs on the switch must be less than or equal to 128. These are examples of switch configurations that meet this condition:
  - If the switch has 2 trunk ports, it can have up to 64 VLANs.
  - If the switch has 32 VLANs, it can have up to 4 trunk ports.
- If your switch is a cluster command switch, it can only support up to eight cluster members.

### Setting Up the Switch to Run SSH

Follow these steps to set up your switch to run SSH:

1. Download the cryptographic software image from Cisco.com. This step is required. For more information, see the release notes for this release.
2. Configure a host name and IP domain name for the switch. Follow this procedure only if you are configuring the switch as an SSH server.
3. Generate an RSA key pair for the switch, which automatically enables SSH. Follow this procedure only if you are configuring the switch as an SSH server.
4. Configure user authentication for local or remote access. This step is required. For more information, see the “Configuring the Switch for Local Authentication and Authorization” section on page 8-32.

Beginning in privileged EXEC mode, follow these steps to configure a host name and an IP domain name and to generate an RSA key pair. This procedure is required if you are configuring the switch as an SSH server.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 hostname hostname</td>
<td>Configure a host name for your switch.</td>
</tr>
<tr>
<td>Step 3 ip domain-name domain_name</td>
<td>Configure a host domain for your switch.</td>
</tr>
<tr>
<td>Step 4 crypto key generate rsa</td>
<td>Enable the SSH server for local and remote authentication on the switch and generate an RSA key pair. We recommend that a minimum modulus size of 1024 bits. When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show ip ssh or show ssh</td>
<td>Show the version and configuration information for your SSH server.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To delete the RSA key pair, use the `crypto key zeroize rsa` global configuration command. After the RSA key pair is deleted, the SSH server is automatically disabled.

### Configuring the SSH Server

Beginning in privileged EXEC mode, follow these steps to configure the SSH server:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>`ip ssh version [1</td>
<td>2]`</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1—Configure the switch to run SSH version 1.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 2—Configure the switch to run SSH version 2.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you do not enter this command or do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client sports SSHv1 and SSHv2, the SSH server selects SSHv2.</td>
</tr>
<tr>
<td>3</td>
<td>`ip ssh {timeout seconds</td>
<td>authentication-retries number}`</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Specify the time-out value in seconds; the default is 120 seconds. The range is 0 to 120 seconds. This parameter applies to the SSH negotiation phase. After the connection is established, the switch uses the default time-out values of the CLI-based sessions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• By default, up to five simultaneous, encrypted SSH connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After the execution shell starts, the CLI-based session time-out value returns to the default of 10 minutes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Specify the number of times that a client can re-authenticate to the server. The default is 3; the range is 0 to 5.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Repeat this step when configuring both parameters.</td>
</tr>
<tr>
<td>4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>5</td>
<td><code>show ip ssh</code> or <code>show ssh</code></td>
<td>Display the version and configuration information for your SSH server. Display the status of the SSH server connections on the switch.</td>
</tr>
<tr>
<td>6</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default SSH control parameters, use the `no ip ssh {timeout | authentication-retries}` global configuration command.
Displaying the SSH Configuration and Status

To display the SSH server configuration and status, use one or more of the privileged EXEC commands in Table 8-2:

<table>
<thead>
<tr>
<th>Command</th>

Configuring IEEE 802.1x Port-Based Authentication

This chapter describes how to configure IEEE 802.1x port-based authentication on the Catalyst 2950 or Catalyst 2955 switch. IEEE 802.1x authentication prevents unauthorized devices (clients) from gaining access to the network.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the “RADIUS Commands” section in the Cisco IOS Security Command Reference, Release 12.1.

This chapter consists of these sections:
- Understanding IEEE 802.1x Port-Based Authentication, page 9-1
- Configuring IEEE 802.1x Authentication, page 9-12
- Displaying IEEE 802.1x Statistics and Status, page 9-28

Understanding IEEE 802.1x Port-Based Authentication

The IEEE 802.1x standard defines a client-server-based access control and authentication protocol that prevents unauthorized clients from connecting to a LAN through publicly accessible ports unless they are properly authenticated. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Until the client is authenticated, IEEE 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

These sections describe IEEE 802.1x port-based authentication:
- Device Roles, page 9-2
- Authentication Initiation and Message Exchange, page 9-3
- Ports in Authorized and Unauthorized States, page 9-4
- IEEE 802.1x Host Mode, page 9-5
- IEEE 802.1x Accounting, page 9-6
- IEEE 802.1x Accounting Attribute-Value Pairs, page 9-6
Device Roles

With IEEE 802.1x port-based authentication, the devices in the network have specific roles as shown in Figure 9-1.

**Figure 9-1  IEEE 802.1x Device Roles**

- **Client**—the device (workstation) that requests access to the LAN and switch services and responds to requests from the switch. The workstation must be running IEEE 802.1x-compliant client software such as that offered in the Microsoft Windows XP operating system. (The client is the supplicant in the IEEE 802.1x standard.)

  To resolve Windows XP network connectivity and IEEE 802.1x authentication issues, read the Microsoft Knowledge Base article at this URL: [http://support.microsoft.com/support/kb/articles/Q303/5/97.ASP](http://support.microsoft.com/support/kb/articles/Q303/5/97.ASP)

- **Authentication server**—performs the actual authentication of the client. The authentication server validates the identity of the client and notifies the switch whether or not the client is authorized to access the LAN and switch services. Because the switch acts as the proxy, the authentication service is transparent to the client. In this release, the RADIUS security system with Extensible Authentication Protocol (EAP) extensions is the only supported authentication server. It is available in Cisco Secure Access Control Server Version 3.0 or later. RADIUS operates in a client/server model in which secure authentication information is exchanged between the RADIUS server and one or more RADIUS clients.

- **Switch** (edge switch or wireless access point)—controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that
information with the authentication server, and relaying a response to the client. The switch includes the RADIUS client, which is responsible for encapsulating and decapsulating the EAP frames and interacting with the authentication server.

When the switch receives EAPOL frames and relays them to the authentication server, the Ethernet header is stripped, and the remaining EAP frame is re-encapsulated in the RADIUS format. The EAP frames are not modified during encapsulation, and the authentication server must support EAP within the native frame format. When the switch receives frames from the authentication server, the server frame header is removed, leaving the EAP frame, which is then encapsulated for Ethernet and sent to the client.

The devices that can act as intermediaries include the Catalyst 3750, 3560, 3550, 2970, 2955, 2950, 2940 switches, or a wireless access point. These devices must be running software that supports the RADIUS client and IEEE 802.1x authentication.

### Authentication Initiation and Message Exchange

During IEEE 802.1x authentication, the switch or the client can initiate authentication. If you enable authentication on a port by using the `dot1x port-control auto` interface configuration command, the switch initiates authentication when the link state changes from down to up or periodically as long as the port remains up and unauthenticated. The switch sends an EAP-request/identity frame to the client to request its identity. Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client’s identity.

---

**Note**

If IEEE 802.1x authentication is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client sends frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated. For more information, see the “Ports in Authorized and Unauthorized States” section on page 9-4.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized. If the authentication fails, authentication can be retried, the port might be assigned to a VLAN that provides limited services, or network access is not granted. For more information, see the “Ports in Authorized and Unauthorized States” section on page 9-4.

The specific exchange of EAP frames depends on the authentication method being used. Figure 9-2 shows a message exchange initiated by the client when the client uses the One-Time-Password (OTP) authentication method with a RADIUS server.
Understanding IEEE 802.1x Port-Based Authentication

Figure 9-2 Message Exchange

Ports in Authorized and Unauthorized States

During IEEE 802.1x authentication, depending on the switch port state, the switch can grant a client access to the network. The port starts in the unauthorized state. While in this state, the port that is not configured as a voice VLAN port disallows all ingress and egress traffic except for IEEE 802.1x authentication, CDP, and STP packets. When a client is successfully authenticated, the port changes to the authorized state, allowing all traffic for the client to flow normally. If the port is configured as a voice VLAN port, the port allows VoIP traffic and IEEE 802.1x protocol packets before the client is successfully authenticated.

If a client that does not support IEEE 802.1x authentication connects to an unauthorized IEEE 802.1x port, the switch requests the client’s identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an IEEE 802.1x-enabled client connects to a port that is not running the IEEE 802.1x standard, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You control the port authorization state by using the `dot1x port-control` interface configuration command and these keywords:

- **force-authorized**—disables IEEE 802.1x authentication and causes the port to transition to the authorized state without any authentication exchange required. The port sends and receives normal traffic without IEEE 802.1x-based authentication of the client. This is the default setting.

- **force-unauthorized**—causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the interface.
Chapter 9  Configuring IEEE 802.1x Port-Based Authentication

Understanding IEEE 802.1x Port-Based Authentication

- **auto**—enables IEEE 802.1x authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port transitions from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the switch by using the client’s MAC address.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can resend the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to transition to the unauthorized state.

If the link state of a port transitions from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

### IEEE 802.1x Host Mode

You can configure an IEEE 802.1x port for single-host or for multiple-hosts mode. In single-host mode (see Figure 9-1 on page 9-2), only one client can be connected to the IEEE 802.1x-enabled switch port. The switch detects the client by sending an EAPOL frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

In multiple-hosts mode, you can attach multiple hosts to a single IEEE 802.1x-enabled port. Figure 9-3 on page 9-5 shows IEEE 802.1x port-based authentication in a wireless LAN. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (re-authentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients. In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

With the multiple-hosts mode enabled, you can use IEEE 802.1x authentication to authenticate the port and port security to manage network access for all MAC addresses, including that of the client.

**Figure 9-3  Multiple Host Mode Example**

Authentication server (RADIUS)
IEEE 802.1x Accounting

The IEEE 802.1x standard defines how users are authorized and authenticated for network access but does not keep track of network usage. IEEE 802.1x accounting is disabled by default. You can enable IEEE 802.1x accounting to monitor this activity on IEEE 802.1x-enabled ports:

- User successfully authenticates.
- User logs off.
- Link-down occurs.
- Re-authentication successfully occurs.
- Re-authentication fails.

The switch does not log IEEE 802.1x accounting information. Instead, it sends this information to the RADIUS server, which must be configured to log accounting messages.

IEEE 802.1x Accounting Attribute-Value Pairs

The information sent to the RADIUS server is represented in the form of Attribute-Value (AV) pairs. These AV pairs provide data for different applications. (For example, a billing application might require information that is in the Acct-Input-Octets or the Acct-Output-Octets attributes of a RADIUS packet.) AV pairs are automatically sent by a switch that is configured for IEEE 802.1x accounting. Three types of RADIUS accounting packets are sent by a switch:

- START--sent when a new user session starts
- INTERIM--sent during an existing session for updates
- STOP--sent when a session terminates

Table 9-1 lists the AV pairs and when they are sent are sent by the switch:

<table>

1. The Framed-IP-Address AV pair is sent only if a valid Dynamic Host Control Protocol (DHCP) binding exists for the host in the DHCP snooping bindings table.

For more information about AV pairs, see RFC 3580, “IEEE 802.1X Remote Authentication Dial In User Service (RADIUS) Usage Guidelines.”

Using IEEE 802.1x Authentication with VLAN Assignment

You can limit network access for certain users by using VLAN assignment. After successful IEEE 802.1x authentication of a port, the RADIUS server sends the VLAN assignment to configure the switch port. The RADIUS server database maintains the username-to-VLAN mappings, assigning the VLAN based on the username of the client connected to the switch port.

When configured on the switch and the RADIUS server, IEEE 802.1x authentication with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server or if IEEE 802.1x authentication is disabled, the port is configured in its access VLAN after successful authentication.
- If IEEE 802.1x authentication is enabled but the VLAN information from the RADIUS server is not valid, the port returns to the unauthorized state and remains in the configured access VLAN. This prevents ports from appearing unexpectedly in an inappropriate VLAN because of a configuration error.
- If IEEE 802.1x authentication is enabled and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If the multiple-hosts mode is enabled on an IEEE 802.1x port, all hosts are placed in the same VLAN (specified by the RADIUS server) as the first authenticated host.
- If IEEE 802.1x authentication and port security are enabled on a port, the port is placed in the RADIUS-server assigned VLAN.
- If IEEE 802.1x authentication is disabled on the port, it is returned to the configured access VLAN.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is placed in the configured access VLAN.

If an IEEE 802.1x port is authenticated and put in the RADIUS-server assigned VLAN, any change to the port access VLAN configuration does not take effect.

The IEEE 802.1x authentication with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN Membership Policy Server (VMPS).

To configure VLAN assignment you need to perform these tasks:

- Enable authentication, authorization, and accounting (AAA) authorization.
Understanding IEEE 802.1x Port-Based Authentication

- Enable IEEE 802.1x authentication (the VLAN assignment feature is automatically enabled when you configure IEEE 802.1x authentication on an access port).
- Assign vendor-specific tunnel attributes in the RADIUS server. The RADIUS server must return these attributes to the switch:
  - [64] Tunnel-Type = VLAN
  - [65] Tunnel-Medium-Type = IEEE 802
  - [81] Tunnel-Private-Group-ID = VLAN name or VLAN ID

Attribute [64] must contain the value VLAN (type 13). Attribute [65] must contain the value IEEE 802 (type 6). Attribute [81] specifies the VLAN name or VLAN ID assigned to the IEEE 802.1x-authenticated user.

For examples of tunnel attributes, see the “Configuring the Switch to Use Vendor-Specific RADIUS Attributes” section on page 8-29.

Using IEEE 802.1x Authentication with Guest VLAN

You can configure a guest VLAN for each IEEE 802.1x port on the switch to provide limited services to clients, such as downloading the IEEE 802.1x client. These clients might be upgrading their system for IEEE 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.

When you enable a guest VLAN on an IEEE 802.1x port, the switch assigns clients to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.

Before Cisco IOS Release 12.1(22)EA2, the switch did not maintain the EAPOL packet history and allowed clients that failed authentication access to the guest VLAN, regardless of whether EAPOL packets had been detected on the interface. You can enable this behavior by using the `dot1x guest-vlan supplicant` global configuration command.

With Cisco IOS Release 12.1(22)EA2 and later, the switch maintains the EAPOL packet history. If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an 802.1x-capable supplicant, and the interface does not change to the guest VLAN state. EAPOL history is cleared if the interface link status goes down. If no EAPOL packet is detected on the interface, the interface changes to the guest VLAN state.

### Note
If an EAPOL packet is detected on the wire after the interface has changed to the guest VLAN, the interface reverts to an unauthorized state, and 802.1x authentication restarts.

Any number of IEEE 802.1x-incapable clients are allowed access when the switch port is moved to the guest VLAN. If an IEEE 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on IEEE 802.1x ports in single-host or multiple-hosts mode.

You can configure any active VLAN except an RSPAN VLAN or a voice VLAN as an IEEE 802.1x guest VLAN. The guest VLAN feature is not supported on trunk ports; it is supported only on access ports.

For configuration steps, see the “Configuring a Guest VLAN” section on page 9-23.
Using IEEE 802.1x Authentication with Restricted VLAN

You can configure a restricted VLAN for each IEEE 802.1x port on a switch to provide limited services to clients that cannot access the guest VLAN. These clients are IEEE 802.1x-compliant and cannot access another VLAN because they fail the authentication process. A restricted VLAN allows users without valid credentials in an authentication server (typically, visitors to an enterprise) to access a limited set of services. The administrator can control the services available to the restricted VLAN.

Note
You can configure a VLAN to be both the guest VLAN and the restricted VLAN if you want to provide the same services to both types of users.

Without this feature, the client attempts and fails authentication indefinitely, and the switch port remains in the spanning-tree blocking state. With this feature, you can configure the switch port to be in the restricted VLAN after a specified number of authentication attempts (the default value is 3 attempts).

The authenticator keeps a count of failed authentication attempts for the client. When this count exceeds the configured maximum number of authentication attempts, the port moves to the restricted VLAN. The failed attempt count is incremented when RADIUS replies with either an \textit{EAP failure} or an empty response that contains no EAP packet. When the port moves into the restricted VLAN, the failed attempt counter resets.

Users who fail authentication remain in the restricted VLAN until the next re-authentication attempt. A port in the restricted VLAN tries to re-authenticate at configured intervals (the default is 60 seconds). If re-authentication fails, the port remains in the restricted VLAN. If re-authentication is successful, the port moves to either the configured VLAN or to a VLAN sent by the RADIUS server. You can disable re-authentication. If you do this, the only way to start the authentication process again is for the port to receive a \textit{link down} or \textit{EAP logoff} event. We recommend that you keep re-authentication enabled if a client might connect through a hub. When a client disconnects from the hub, the port might not receive the \textit{link down} or \textit{EAP logoff} event.

After a port moves to the restricted VLAN, it sends a simulated EAP success message to the client. This prevents clients from attempting authentication indefinitely. Some clients (for example, devices running Windows XP) cannot implement DHCP without EAP success.

Restricted VLANs are supported only on IEEE 802.1x ports in single-host mode and on Layer 2 ports. You can configure any active VLAN except an RSPAN VLAN or a voice VLAN as an IEEE 802.1x restricted VLAN. The restricted VLAN feature is not supported on trunk ports; it is supported only on access ports.

This feature works with port security. As soon as the port is authorized, a MAC address is provided to port security. If port security does not permit the MAC address or if the maximum secure address count is reached, the port becomes unauthorized and error disabled.

Other port security features such as Dynamic ARP Inspection, DHCP snooping, and IP source guard can be configured independently on a restricted VLAN.

For more information, see the “Configuring a Restricted VLAN” section on page 9-24.
Using IEEE 802.1x Authentication with Voice VLAN Ports

A voice VLAN port is a special access port associated with two VLAN identifiers:
- VVID to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.
- PVID to carry the data traffic to and from the workstation connected to the switch through the IP phone. The PVID is the native VLAN of the port.

In single-host mode, only the IP phone is allowed on the voice VLAN. In multiple-hosts mode, additional clients can send traffic on the voice VLAN after a supplicant is authenticated on the PVID. When multiple-hosts mode is enabled, the supplicant authentication affects both the PVID and the VVID.

A voice VLAN port becomes active when there is a link, and the device MAC address appears after the first CDP message from the IP phone. Cisco IP phones do not relay CDP messages from other devices. As a result, if several Cisco IP phones are connected in series, the switch recognizes only the one directly connected to it. When IEEE 802.1x authentication is enabled on a voice VLAN port, the switch drops packets from unrecognized Cisco IP phones more than one hop away.

When IEEE 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.

For more information about voice VLANs, see Chapter 18, “Configuring Voice VLAN.”

Using IEEE 802.1x Authentication with Port Security

You can configure an IEEE 802.1x port with port security in either single-host or multiple-hosts mode. (You must also configure port security on the port by using the switchport port-security interface configuration command.) When you enable port security and IEEE 802.1x on a port, IEEE 802.1x authentication authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network through an IEEE 802.1x port.

These are some examples of the interaction between IEEE 802.1x authentication and port security on the switch:
- When a client is authenticated, and the port security table is not full, the client’s MAC address is added to the port security list of secure hosts. The port then proceeds to come up normally. When a client is authenticated and manually configured for port security, it is guaranteed an entry in the secure host table (unless port security static aging has been enabled).
  A security violation occurs if the client is authenticated, but port security table is full. This can happen if the maximum number of secure hosts has been statically configured, or if the client ages out of the secure host table. If the client’s address is aged out, its place in the secure host table can be taken by another host.
  The port security violation modes determine the action for security violations. For more information, see the “Security Violations” section on page 21-7.
  When you manually remove an IEEE 802.1x client address from the port security table by using the no switchport port-security mac-address mac-address interface configuration command, you should re-authenticate the IEEE 802.1x client by using the dot1x re-authenticate interface interface-id privileged EXEC command.
When an IEEE 802.1x client logs off, the port changes to an unauthenticated state, and all dynamic entries in the secure host table are cleared, including the entry for the client. Normal authentication then takes place.

If the port is administratively shut down, the port becomes unauthenticated, and all dynamic entries are removed from the secure host table.

Port security and a voice VLAN can be configured simultaneously on an IEEE 802.1x port that is in either single-host or multiple-hosts mode. Port security applies to both the voice VLAN identifier (VVID) and the port VLAN identifier (PVID).

For more information about enabling port security on your switch, see the “Configuring Port Security” section on page 21-6.

Using IEEE 802.1x Authentication with Wake-on-LAN

The IEEE 802.1x wake-on-LAN (WoL) feature allows dormant PCs to be powered when the switch receives a specific Ethernet frame, known as the magic packet. You can use this feature in environments where administrators need to connect to systems that have been powered down. This feature is also known as the unidirectional controlled port in the IEEE 802.1x standard.

When a host that uses WoL are attached through an IEEE 802.1x port and the host powers off, the IEEE 802.1x port becomes unauthorized. The port can only receive and send EAPOL packets, and WoL magic packets cannot reach the host. When the PC is powered off, it is not authorized, and the switch port is not opened.

When the switch uses IEEE 802.1x authentication with WoL, the switch forwards traffic to unauthorized IEEE 802.1x ports, including magic packets. While the port is unauthorized, the switch continues to block ingress traffic other than EAPOL packets. The host can receive packets but cannot send packets to other devices in the network.

Note

If PortFast is not enabled on the port, the port is forced to the bidirectional state.

When you configure a port as unidirectional by using the `dot1x control-direction in` interface configuration command, the port changes to the spanning-tree forwarding state. The port can send packets to the host but cannot receive packets from the host.

When you configure a port as bidirectional by using the `dot1x control-direction both` interface configuration command, the port is access-controlled in both directions. The port does not receive packets from or send packets to the host.

Network Admission Control Layer 2 IEEE 802.1x Validation

In Cisco IOS Release 12.1(22)EA6 and later, the switch supports the Network Admission Control (NAC) Layer 2 IEEE 802.1x validation, which checks the antivirus condition or posture of endpoint systems or clients before granting the devices network access. With NAC Layer 2 IEEE 802.1x validation, you can do these tasks:

- Download the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute[29]) from the authentication server.

- Set the number of seconds between re-authentication attempts as the value of the Session-Timeout RADIUS attribute (Attribute[27]) and get an access policy against the client from the RADIUS server.
Configuring IEEE 802.1x Authentication

These sections describe how to configure IEEE 802.1x port-based authentication on your switch:

- Default IEEE 802.1x Authentication Configuration, page 9-12
- IEEE 802.1x Authentication Configuration Guidelines, page 9-13
- Upgrading from a Previous Software Release, page 9-15

IEEE 802.1x Authentication

These are the IEEE 802.1x authentication configuration guidelines:

- When IEEE 802.1x authentication is enabled, ports are authenticated before any other Layer 2 features are enabled.
- The IEEE 802.1x protocol is supported on Layer 2 static-access ports and voice VLAN ports, but it is not supported on these port types:
  - Trunk port—If you try to enable IEEE 802.1x authentication on a trunk port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.
  - Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x authentication on a dynamic port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.
  - Dynamic-access ports—If you try to enable IEEE 802.1x authentication on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.
  - EtherChannel ports—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.
  - Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You cannot enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port or that is an RSPAN reflector port. However, you can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.
  - LRE switch ports—IEEE 802.1x is not supported on an LRE switch interface that is connected to a Cisco 585 LRE CPE device.

- Before globally enabling IEEE 802.1x authentication on a switch by entering the `dot1x system-auth-control` global configuration command, remove the EtherChannel configuration from the interfaces on which IEEE 802.1x authentication and EtherChannel are configured.
- If you are using a device running the Cisco Access Control Server (ACS) application for IEEE 802.1x authentication with EAP-Transparent LAN Services (TLS) and EAP-MD5 and your switch is running Cisco IOS Release 12.1(14)EA1, make sure that the device is running ACS Version 3.2.1 or later.

VLAN Assignment, Guest VLAN, and Restricted VLAN

These are the configuration guidelines for VLAN assignment, guest VLAN, and restricted VLAN:

- When IEEE 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.
- The IEEE 802.1x authentication with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VMPS.
- You can configure any VLAN, except an RSPAN VLAN or a voice VLAN, as an IEEE 802.1x guest VLAN. The guest VLAN feature is not supported on trunk ports; it is supported only on access ports.
- After you configure a guest VLAN for an IEEE 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can also change the settings for restarting the IEEE 802.1x authentication process on the switch before the DHCP process on the
client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the IEEE 802.1x authentication process (dot1x timeout quiet-period and dot1x timeout tx-period interface configuration commands). The amount to decrease the settings depends on the connected IEEE 802.1x client type.

- When a PC is attached to a switch through a hub, is authenticated on an IEEE 802.1x multiple-hosts port, is moved to another port, and is then attached through another hub, the switch does not authenticate the PC. The workaround is to decrease the number of seconds between re-authentication attempts by entering the dot1x timeout reauth-period seconds interface configuration command.

- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an IEEE 802.1x authentication restricted VLAN. The restricted VLAN feature is not supported on trunk ports; it is supported only on access ports.

Upgrading from a Previous Software Release

In Cisco IOS Release 12.1(14)EA1, the implementation for IEEE 802.1x authentication changed from the previous release. Some global configuration commands became interface configuration commands, and new commands were added.

If you have IEEE 802.1x authentication configured on the switch and you upgrade to Cisco IOS Release 12.1(14)EA1 or later, the configuration file will not contain the new commands, and IEEE 802.1x authentication will not operate. After the upgrade is complete, make sure to globally enable IEEE 802.1x authentication by using the dot1x system-auth-control global configuration command. If IEEE 802.1x authentication was running in multiple-hosts mode on an interface in the previous release, make sure to reconfigure it by using the dot1x host-mode multi-host interface configuration command.

Configuring IEEE 802.1x Authentication

To configure IEEE 802.1x port-based authentication, you must enable AAA and specify the authentication method list. A method list describes the sequence and authentication methods to be queried to authenticate a user.

The software uses the first method listed to authenticate users. If that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle, the authentication process stops, and no other authentication methods are attempted.

To allow VLAN assignment, you must enable AAA authorization to configure the switch for all network-related service requests.

This is the IEEE 802.1x AAA process:

Step 1  A user connects to a port on the switch.
Step 2  Authentication is performed.
Step 3  VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.
Step 4  The switch sends a start message to an accounting server.
Step 5  Re-authentication is performed, as necessary.
Configuring IEEE 802.1x Port-Based Authentication

### Step 6
The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.

### Step 7
The user disconnects from the port.

### Step 8
The switch sends a stop message to the accounting server.

Beginning in privileged EXEC mode, follow these steps to configure IEEE 802.1x port-based authentication. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 aaa new-model</td>
<td>Enable AAA.</td>
</tr>
<tr>
<td>Step 3 aaa authentication dot1x {default}</td>
<td>Create an IEEE 802.1x authentication method list.</td>
</tr>
<tr>
<td>method1</td>
<td>To create a default list that is used when a named list is not specified in the authentication command, use the default keyword followed by the method that is to be used in default situations. The default method list is automatically applied to all ports.</td>
</tr>
<tr>
<td></td>
<td>For method1, enter the group radius keyword to use the list of all RADIUS servers for authentication.</td>
</tr>
<tr>
<td></td>
<td>Note Though other keywords are visible in the command-line help string, only the default and group radius keywords are supported.</td>
</tr>
<tr>
<td>Step 4 dot1x system-auth-control</td>
<td>Enable IEEE 802.1x authentication globally on the switch.</td>
</tr>
<tr>
<td>Step 5 aaa authorization network {default}</td>
<td>(Optional) Configure the switch for user RADIUS authorization for all network-related service requests, such as VLAN assignment.</td>
</tr>
<tr>
<td>group radius</td>
<td></td>
</tr>
<tr>
<td>Step 6 radius-server host ip-address</td>
<td>(Optional) Specify the IP address of the RADIUS server.</td>
</tr>
<tr>
<td>Step 7 radius-server key string</td>
<td>(Optional) Specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.</td>
</tr>
<tr>
<td>Step 8 interface interface-id</td>
<td>Specify the port connected to the client that is to be enabled for IEEE 802.1x authentication, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 9 switchport mode access</td>
<td>(Optional) Set the port to access mode only if you configured the RADIUS server in Step 6 and Step 7.</td>
</tr>
<tr>
<td>Step 10 dot1x port-control auto</td>
<td>Enable IEEE 802.1x authentication on the interface.</td>
</tr>
<tr>
<td></td>
<td>For feature interaction information, see the “IEEE 802.1x Authentication Configuration Guidelines” section on page 9-13.</td>
</tr>
<tr>
<td>Step 11 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 12 show dot1x</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td></td>
<td>Check the Status column in the IEEE 802.1x Port Summary section of the display. An enabled status means the port-control value is set to either auto or to force-unauthorized.</td>
</tr>
<tr>
<td>Step 13 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring IEEE 802.1x Port-Based Authentication

To disable AAA, use the `no aaa new-model` global configuration command. To disable IEEE 802.1x AAA authentication, use the `no aaa authentication dot1x {default | list-name}` global configuration command. To disable IEEE 802.1x AAA authorization, use the `no aaa authorization global configuration` command. To disable IEEE 802.1x authentication on the switch, use the `no dot1x system-auth-control` global configuration command.

This example shows how to enable AAA and IEEE 802.1x authentication on a port:

```
Switch# configure terminal
Switch(config)# aaa new-model
Switch(config)# aaa authentication dot1x default group radius
Switch(config)# dot1x system-auth-control
Switch(config)# interface fastethernet0/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
```

Configuring the Switch-to-RADIUS-Server Communication

RADIUS security servers are identified by their host name or IP address, host name and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the fail-over backup to the first one. The RADIUS host entries are tried in the order that they were configured.

Beginning in privileged EXEC mode, follow these steps to configure the RADIUS server parameters on the switch. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>radius-server host [hostname</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
</tbody>
</table>
Configuring IEEE 802.1x Port-Based Authentication

Configuring IEEE 802.1x Authentication

To delete the specified RADIUS server, use the **no radius-server host** \(\{hostname | ip-address\}\) global configuration command.

This example shows how to specify the server with IP address 172.20.39.46 as the RADIUS server, to use port 1612 as the authorization port, and to set the encryption key to `rad123`, matching the key on the RADIUS server:

```
Switch(config)# radius-server host 172.20.39.46 auth-port 1612 key rad123
```

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the **radius-server host** global configuration command. If you want to configure these options on a per-server basis, use the **radius-server timeout**, **radius-server retransmit**, and the **radius-server key** global configuration commands. For more information, see the “Configuring Settings for All RADIUS Servers” section on page 8-28.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

### Configuring the Host Mode

Beginning in privileged EXEC mode, follow these steps to allow multiple hosts (clients) on an IEEE 802.1x-authorized port that has the **dot1x port-control** interface configuration command set to `auto`. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface to which multiple hosts are indirectly attached, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 dot1x host-mode multi-host</td>
<td>Allow multiple hosts (clients) on an IEEE 802.1x-authorized port. Make sure that the <strong>dot1x port-control</strong> interface configuration command set is set to <code>auto</code> for the specified interface.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show dot1x interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable multiple hosts on the port, use the **no dot1x host-mode multi-host** interface configuration command.

This example shows how to enable IEEE 802.1x authentication and to allow multiple hosts:

```
Switch(config)# interface fastethernet0/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-host
```
Enabling Periodic Re-Authentication

You can enable periodic IEEE 802.1x client re-authentication and specify how often it occurs. If you do not specify a time period before enabling re-authentication, the number of seconds between re-authentication attempts is 3600.

Beginning in privileged EXEC mode, follow these steps to enable periodic re-authentication of the client and to configure the number of seconds between re-authentication attempts. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>dot1x reauthentication</td>
</tr>
<tr>
<td>Step 4</td>
<td>dot1x timeout reauth-period [seconds</td>
</tr>
<tr>
<td></td>
<td>server]</td>
</tr>
<tr>
<td></td>
<td>server]</td>
</tr>
<tr>
<td>Note</td>
<td>The server keyword is not supported on Catalyst 2950 LRE switches.</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show dot1x interface interface-id</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable periodic re-authentication, use the no dot1x reauthentication interface configuration command. To return to the default number of seconds between re-authentication attempts, use the no dot1x timeout reauth-period global configuration command.

This example shows how to enable periodic re-authentication and set the number of seconds between re-authentication attempts to 4000:

```
Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period 4000
```

Manually Re-Authenticating a Client Connected to a Port

You can manually re-authenticate the client connected to a specific port at any time by entering the dot1x re-authenticate interface interface-id privileged EXEC command. This step is optional. If you want to enable or disable periodic re-authentication, see the “Enabling Periodic Re-Authentication” section on page 9-19.

This example shows how to manually re-authenticate the client connected to a port:

```
Switch# dot1x re-authenticate interface fastethernet0/1
```
Changing the Quiet Period

When the switch cannot authenticate the client, the switch remains idle for a set period of time, and then tries again. The idle time is determined by the quiet-period value. A failed authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a smaller number than the default.

Beginning in privileged EXEC mode, follow these steps to change the quiet period. This procedure is optional.

To return to the default quiet time, use the `no dot1x timeout quiet-period` interface configuration command.

This example shows how to set the quiet time on the switch to 30 seconds:

```
Switch(config-if)# dot1x timeout quiet-period 30
```

Changing the Switch-to-Client Retransmission Time

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then resend the frame.

![Note](image)

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to change the amount of time that the switch waits for client notification. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>dot1x timeout quiet-period seconds</td>
<td>Set the number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client. The range is 1 to 65535 seconds; the default is 60.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show dot1x interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default quiet time, use the `no dot1x timeout quiet-period` interface configuration command.

This example shows how to set the quiet time on the switch to 30 seconds:

```
Switch(config-if)# dot1x timeout quiet-period 30
```
To return to the default retransmission time, use the `no dot1x timeout tx-period` interface configuration command.

This example shows how to set 60 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request:

```
Switch(config-if)# dot1x timeout tx-period 60
```

### Setting the Switch-to-Client Frame-Retransmission Number

In addition to changing the switch-to-client retransmission time, you can change the number of times that the switch sends an EAP-request/identity frame (assuming no response is received) to the client before restarting the authentication process.

**Note**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the switch-to-client frame-retransmission number. This procedure is optional.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>dot1x max-req count</td>
<td>Set the number of times that the switch sends an EAP-request/identity frame to the client before restarting the authentication process. The range is 1 to 10; the default is 2.</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>show dot1x interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default retransmission number, use the `no dot1x max-req` interface configuration command.

This example shows how to set 5 as the number of times that the switch sends an EAP-request/identity request before restarting the authentication process:

```
Switch(config-if)# dot1x max-req 5
```
Configuring IEEE 802.1x Accounting

Enabling AAA system accounting with IEEE 802.1x accounting allows system reload events to be sent to the accounting RADIUS server for logging. The server can then infer that all active IEEE 802.1x sessions are closed.

Because RADIUS uses the unreliable UDP transport protocol, accounting messages might be lost due to poor network conditions. If the switch does not receive the accounting response message from the RADIUS server after a configurable number of retransmissions of an accounting request, this system message appears:

Accounting message %s for session %s failed to receive Accounting Response.

When the stop message is not sent successfully, this message appears:

00:09:55: %RADIUS-3-NOACCOUNTINGRESPONSE: Accounting message Start for session 172.20.50.145 sam 11/06/03 07:01:16 11000002 failed to receive Accounting Response.

Note

You must configure the RADIUS server to perform accounting tasks, such as logging start, stop, and interim-update messages and time stamps. To turn on these functions, enable logging of “Update/Watchdog packets from this AAA client” in your RADIUS server Network Configuration tab. Next, enable “CVS RADIUS Accounting” in your RADIUS server System Configuration tab.

Beginning in privileged EXEC mode, follow these steps to configure IEEE 802.1x accounting after AAA is enabled on your switch. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code> Specify the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>aaa accounting dot1x default start-stop group radius</code> Enable IEEE 802.1x accounting using the list of all RADIUS servers.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>aaa accounting system default start-stop group radius</code> (Optional) Enables system accounting (using the list of all RADIUS servers) and generates system accounting reload event messages when the switch reloads.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>show running-config</code> Verify your entries.</td>
</tr>
<tr>
<td>Step 7</td>
<td><code>copy running-config startup-config</code> (Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `show radius statistics` privileged EXEC command to display the number of RADIUS messages that do not receive the accounting response message.

This example shows how to configure IEEE 802.1x accounting. The first command configures the RADIUS server, specifying 1813 as the UDP port for accounting:

```
Switch(config)# radius-server host 172.120.39.46 auth-port 1812 acct-port 1813 key rad123
Switch(config)# aaa accounting dot1x default start-stop group radius
Switch(config)# aaa accounting system default start-stop group radius
```
Configuring a Guest VLAN

When you configure a guest VLAN, clients that are not IEEE 802.1x-capable are put into the guest VLAN when the server does not receive a response to its EAPOL request/identity frame. Clients that are IEEE 802.1x-capable but fail authentication are not granted access to the network. The switch supports guest VLANs in single-host or multiple-hosts mode.

You can enable optional guest VLAN behavior by using the `dot1x guest-vlan supplicant` global configuration command. When enabled, the switch does not maintain the EAPOL packet history and allows clients that fail authentication to access the guest VLAN, regardless of whether EAPOL packets had been detected on the interface. Clients that fail authentication can access the guest VLAN.

**Note**
Depending on the switch configuration, assigning the client to a guest VLAN can take up to several minutes.

Beginning in privileged EXEC mode, follow these steps to configure a guest VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code> Specify the interface to be configured, and enter interface configuration mode. For the supported interface types, see the “IEEE 802.1x Authentication Configuration Guidelines” section on page 9-13.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>switchport mode access</code> Set the port to access mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>dot1x port-control auto</code> Enable IEEE 802.1x authentication on the port.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>dot1x guest-vlan vlan-id</code> Specify an active VLAN as an IEEE 802.1x guest VLAN. The range is 1 to 4094. You can configure any active VLAN except an RSPAN VLAN or a voice VLAN as an IEEE 802.1x guest VLAN.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td><code>show dot1x interface interface-id</code> Verify your entries.</td>
</tr>
<tr>
<td>Step 8</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable and remove the guest VLAN, use the `no dot1x guest-vlan` interface configuration command. The port returns to the unauthorized state.

This example shows how to enable VLAN 9 as an IEEE 802.1x guest VLAN on a port:

```
Switch(config)# interface fastethernet0/1
Switch(config-if)# dot1x guest-vlan 9
```

This example shows how to set 3 as the quiet time on the switch, to set 15 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request, and to enable VLAN 2 as an IEEE 802.1x guest VLAN when an IEEE 802.1x port is connected to a DHCP client:

```
Switch(config-if)# dot1x timeout quiet-period 3
Switch(config-if)# dot1x timeout tx-period 15
Switch(config-if)# dot1x guest-vlan 2
```
You can enable optional guest VLAN behavior by using the `dot1x guest-vlan supplicant` global configuration command. When enabled, the switch does not maintain the EAPOL packet history and allows clients that fail authentication access to the guest VLAN, regardless of whether EAPOL packets had been detected on the interface.

Beginning in privileged EXEC mode, follow these steps to enable the optional guest VLAN behavior and to configure a guest VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>dot1x guest-vlan supplicant</td>
</tr>
<tr>
<td>Step 3</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport mode access</td>
</tr>
<tr>
<td>Step 5</td>
<td>dot1x port-control auto</td>
</tr>
<tr>
<td>Step 6</td>
<td>dot1x guest-vlan vlan-id</td>
</tr>
<tr>
<td>Step 7</td>
<td>end</td>
</tr>
<tr>
<td>Step 8</td>
<td>show dot1x interface interface-id</td>
</tr>
<tr>
<td>Step 9</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable the optional guest VLAN behavior, use the `no dot1x guest-vlan supplicant` global configuration command. To remove the guest VLAN, use the `no dot1x guest-vlan` interface configuration command. If the port is currently authorized in the guest VLAN, the port returns to the unauthorized state.

This example shows how enable the optional guest VLAN behavior and to specify VLAN 5 as an IEEE 802.1x guest VLAN:
```
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x guest-vlan 5
```

## Configuring a Restricted VLAN

When you configure a restricted VLAN on a switch, clients that are IEEE 802.1x-compliant are moved into the restricted VLAN when the authentication server does not receive a valid username and password. The switch supports restricted VLANs only in single-host mode.
Beginning in privileged EXEC mode, follow these steps to configure a restricted VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the port to be configured, and enter interface configuration mode. For the supported port types, see the “IEEE 802.1x Authentication Configuration Guidelines” section on page 9-13.</td>
</tr>
<tr>
<td>Step 3 switchport mode access</td>
<td>Set the port to access mode.</td>
</tr>
<tr>
<td>Step 4 dot1x port-control auto</td>
<td>Enable IEEE 802.1x authentication on the port.</td>
</tr>
<tr>
<td>Step 5 dot1x auth-fail vlan vlan-id</td>
<td>Specify an active VLAN as an IEEE 802.1x restricted VLAN. The range is 1 to 4094. You can configure any active VLAN except an RSPAN VLAN or a voice VLAN as an IEEE 802.1x restricted VLAN.</td>
</tr>
<tr>
<td>Step 6 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7 show dot1x interface interface-id</td>
<td>(Optional) Verify your entries.</td>
</tr>
<tr>
<td>Step 8 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable and remove the restricted VLAN, use the `no dot1x auth-fail vlan` interface configuration command. The port returns to the unauthorized state.

This example shows how to enable VLAN 2 as an IEEE 802.1x restricted VLAN:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x auth-fail vlan 2
```

You can configure the maximum number of authentication attempts allowed before a user is assigned to the restricted VLAN by using the `dot1x auth-fail max-attempts` interface configuration command. The range of allowable authentication attempts is 1 to 3. The default is 3 attempts.

Beginning in privileged EXEC mode, follow these steps to configure the maximum number of allowed authentication attempts. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>

<tr>
<td>Step 5 dot1x auth-fail vlan vlan-id</td>
<td>Specify an active VLAN as an IEEE 802.1x restricted VLAN. The range is 1 to 4094. You can configure any active VLAN except an RSPAN VLAN or a voice VLAN as an IEEE 802.1x restricted VLAN.</td>
</tr>
<tr>
<td>Step 6 dot1x auth-fail max-attempts max attempts</td>
<td>Specify a number of authentication attempts to allow before a port moves to the restricted VLAN. The range is 1 to 3, and the default is 3.</td>
</tr>
<tr>
<td>Step 7 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Configuring IEEE 802.1x Port-Based Authentication

### Configuring IEEE 802.1x Authentication

To return to the default value, use the `no dot1x auth-fail max-attempts` interface configuration command.

This example shows how to set 2 as the number of authentication attempts allowed before the port moves to the restricted VLAN:

```
Switch(config-if)# dot1x auth-fail max-attempts 2
```

#### Configuring IEEE 802.1x Authentication with WoL

Beginning in privileged EXEC mode, follow these steps to enable IEEE 802.1x authentication with WoL. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code> Specify the port to be configured, and enter interface configuration mode. For the supported port types, see the “IEEE 802.1x Authentication Configuration Guidelines” section on page 9-13.</td>
</tr>
</tbody>
</table>
| Step 3  | `dot1x control-direction {both | in}` Enable IEEE 802.1x authentication with WoL on the port, and use these keywords to configure the port as bidirectional or unidirectional.  
- **both**—Sets the port as bidirectional. The port cannot receive packets from or send packets to the host. By default, the port is bidirectional.  
- **in**—Sets the port as unidirectional. The port can send packets to the host but cannot receive packets from the host. |
| Step 4  | `end` Return to privileged EXEC mode. |
| Step 5  | `show dot1x interface interface-id` Verify your entries. |
| Step 6  | `copy running-config startup-config` (Optional) Save your entries in the configuration file. |

To disable IEEE 802.1x authentication with WoL, use the `no dot1x control-direction` interface configuration command.

This example shows how to enable IEEE 802.1x authentication with WoL and set the port as bidirectional:

```
Switch(config-if)# dot1x control-direction both
```
Configuring NAC Layer 2 IEEE 802.1x Validation

In Cisco IOS Release 12.1(22)EA6 or later, you can configure NAC Layer 2 IEEE 802.1x validation, which is also referred to as IEEE 802.1x authentication with a RADIUS server.

Beginning in privileged EXEC mode, follow these steps to configure NAC Layer 2 IEEE 802.1x validation. The procedure is optional.

On Catalyst 2950 LRE switches, you cannot configure IEEE 802.1x authentication using a RADIUS server.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specify the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> dot1x guest-vlan vlan-id</td>
<td>Specify an active VLAN as an IEEE 802.1x guest VLAN. The range is 1 to 4094. You can configure any active VLAN except an RSPAN VLAN or a voice VLAN as an IEEE 802.1x guest VLAN.</td>
</tr>
<tr>
<td><strong>Step 4</strong> dot1x reauthentication</td>
<td>Enable periodic re-authentication of the client, which is disabled by default.</td>
</tr>
<tr>
<td><strong>Step 5</strong> dot1x timeout reauth-period {seconds</td>
<td>server}</td>
</tr>
<tr>
<td></td>
<td>• seconds—Sets the number of seconds from 1 to 65535; the default is 3600 seconds.</td>
</tr>
<tr>
<td></td>
<td>• server—Sets the number of seconds as the value of the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]). This command affects the behavior of the switch only if periodic re-authentication is enabled.</td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong> show dot1x interface interface-id</td>
<td>Verify your IEEE 802.1x authentication configuration.</td>
</tr>
<tr>
<td><strong>Step 8</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to configure NAC Layer 2 IEEE 802.1x validation:

Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period server
Chapter 9  Configuring IEEE 802.1x Port-Based Authentication

Displaying IEEE 802.1x Statistics and Status

To display IEEE 802.1x statistics for all interfaces, use the `show dot1x all statistics` privileged EXEC command. To display IEEE 802.1x statistics for a specific interface, use the `show dot1x statistics interface interface-id` privileged EXEC command.

To display the IEEE 802.1x administrative and operational status for the switch, use the `show dot1x all` privileged EXEC command. To display the IEEE 802.1x administrative and operational status for a specific interface, use the `show dot1x interface interface-id` privileged EXEC command.

For detailed information about the fields in these displays, see the command reference for this release.

Resetting the IEEE 802.1x Configuration to the Default Values

Beginning in privileged EXEC mode, follow these steps to reset the IEEE 802.1x configuration to the default values.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code> Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>dot1x default</code> Reset the configurable IEEE 802.1x parameters to the default values.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show dot1x interface interface-id</code> Verify your entries.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
This chapter describes the types of interfaces on a Catalyst 2950 or Catalyst 2955 and how to configure them. The chapter has these sections:

- Understanding Interface Types, page 10-1
- Using the Interface Command, page 10-4
- Configuring Ethernet Interfaces, page 10-8
- Monitoring and Maintaining the Interfaces, page 10-15

**Note**
For complete syntax and usage information for the commands used in this chapter, see the switch command reference for this release and the online *Cisco IOS Interface Command Reference for Cisco IOS Release 12.1*.

**Understanding Interface Types**

This section describes the different types of interfaces supported by the switch with references to chapters that contain more detailed information about configuring these interface types. The rest of the chapter describes configuration procedures for switch ports.

Switch ports are Layer 2-only interfaces associated with a physical port. They are used for managing the physical interface and associated Layer 2 protocols and do not handle routing or bridging. A switch port can be an access port or a trunk port.

You can configure a port as an access port or trunk port or let the Dynamic Trunking Protocol (DTP) operate on a per-port basis to determine if a switch port should be an access port or a trunk port by negotiating with the port on the other end of the link.

Configure switch ports by using the `switchport` interface configuration commands. For detailed information about configuring access port and trunk port characteristics, see *Chapter 16, “Configuring VLANs.”*

**Note**
The physical switch ports can be 10/100 Ethernet ports, 10/100/1000 Ethernet ports, 100BASE-FX ports, 1000BASE-SX ports, Long-Reach Ethernet (LRE) ports, Gigabit Interface Converter (GBIC) module ports, or small form-factor pluggable (SFP)-module ports. For more information, see the switch hardware installation guide.
These sections describes these types of interfaces:

- Access Ports, page 10-2
- Trunk Ports, page 10-2
- Port-Based VLANs, page 10-3
- EtherChannel Port Groups, page 10-3
- Connecting Interfaces, page 10-4

**Access Ports**

An access port belongs to and carries the traffic of only one VLAN (unless it is configured as a voice VLAN port). Traffic is received and sent in native formats with no VLAN tagging. Traffic arriving on an access port is assumed to belong to the VLAN assigned to the port. If an access port receives an IEEE 802.1p- or 802.1Q-tagged packet for the VLAN assigned to the port, the packet is forwarded. If the port receives an IEEE 802.1p- or IEEE 802.1Q-tagged packet for another VLAN, the packet is dropped, the source address is not learned, and the frame is counted in the No destination statistic.

The Catalyst 2950 or Catalyst 2955 switch does not support ISL-tagged packets. If the switch receives an ISL-tagged packet, the packet is flooded in the native VLAN of the port on which it was received because the MAC destination address in the ISL-tagged packet is a multicast address.

Two types of access ports are supported:

- Static access ports are manually assigned to a VLAN.
- VLAN membership of dynamic access ports is learned through incoming packets. By default, a dynamic access port is a member of no VLAN, and forwarding to and from the port is enabled only when the VLAN membership of the port is discovered. Dynamic access ports on the switch are assigned to a VLAN by a VLAN Membership Policy Server (VMPS). The VMPS can be a Catalyst 6000 series switch; the Catalyst 2950 or Catalyst 2955 switch does not support the function of a VMPS.

You can also configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone. For more information about voice VLAN ports, see Chapter 15, “Configuring Voice VLAN.”

**Trunk Ports**

A trunk port carries the traffic of multiple VLANs and by default is a member of all VLANs in the VLAN database. Only IEEE 802.1Q trunk ports are supported. An IEEE 802.1Q trunk port supports simultaneous tagged and untagged traffic. An IEEE 802.1Q trunk port is assigned a default Port VLAN ID (PVID), and all untagged traffic travels on the port default PVID. All untagged traffic and tagged traffic with a NULL VLAN ID are assumed to belong to the port default PVID. A packet with a VLAN ID equal to the outgoing port default PVID is sent untagged. All other traffic is sent with a VLAN tag.

Although by default, a trunk port is a member of every VLAN known to the VTP, you can limit VLAN membership by configuring an allowed list of VLANs for each trunk port. The list of allowed VLANs does not affect any other port but the associated trunk port.

All possible VLANs (VLAN ID 1 to 1005 when the standard software image [SI] is installed or VLAN ID 1 to 4094 when the enhanced software image [EI] is installed)
A trunk port can only become a member of a VLAN if VTP knows of the VLAN and the VLAN is in the enabled state. If VTP learns of a new, enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of that VLAN and traffic is forwarded to and from the trunk port for that VLAN. If VTP learns of a new, enabled VLAN that is not in the allowed list for a trunk port, the port does not become a member of the VLAN, and no traffic for the VLAN is forwarded to or from the port.

For more information about trunk ports, see Chapter 16, “Configuring VLANs.”

**Port-Based VLANs**

A VLAN is a switched network that is logically segmented by function, team, or application, without regard to the physical location of the users. For more information about VLANs, see Chapter 16, “Configuring VLANs.” Packets received on a port are forwarded only to ports that belong to the same VLAN as the receiving port. Network devices in different VLANs cannot communicate with one another without a Layer 3 device to route traffic between the VLANs.

VLAN partitions provide hard firewalls for traffic in the VLAN, and each VLAN has its own MAC address table. A VLAN comes into existence when a local port is configured to be associated with the VLAN, when the VLAN Trunking Protocol (VTP) learns of its existence from a neighbor on a trunk, or when a user creates a VLAN.

To configure normal-range VLANs (VLAN IDs 1 to 1005), use the `vlan vlan-id` global configuration command to enter config-vlan mode or the `vlan database` privileged EXEC command to enter VLAN configuration mode. The VLAN configurations for VLAN IDs 1 to 1005 are saved in the VLAN database. To configure extended-range VLANs (VLAN IDs 1006 to 4094) when the EI is installed, you must use config-vlan mode with VTP mode set to transparent. Extended-range VLANs are not added to the VLAN database. When VTP mode is transparent, the VTP and VLAN configuration is saved in the switch running configuration, and you can save it in the switch startup configuration file by entering the `copy running-config startup-config` privileged EXEC command.

Add ports to a VLAN by using the `switchport` interface configuration commands:

- Identify the interface.
- For a trunk port, set trunk characteristics, and if desired, define the VLANs to which it can belong.
- For an access port, set and define the VLAN to which it belongs.

**EtherChannel Port Groups**

EtherChannel port groups provide the ability to treat multiple switch ports as one switch port. These port groups act as a single logical port for high-bandwidth connections between switches or between switches and servers. An EtherChannel balances the traffic load across the links in the channel. If a link within the EtherChannel fails, traffic previously carried over the failed link changes to the remaining links. You can group multiple trunk ports into one logical trunk port or group multiple access ports into one logical access port. Most protocols operate over either single ports or aggregated switch ports and do not recognize the physical ports within the port group. Exceptions are the DTP, the Cisco Discovery Protocol (CDP), the Port Aggregation Protocol (PAgP), and Link Aggregation Control Protocol (LACP) which operate only on physical ports.
When you configure an EtherChannel, you create a port-channel logical interface and assign an interface to the EtherChannel. For Layer 2 interfaces, the logical interface is dynamically created. You manually assign an interface to the EtherChannel by using the `channel-group` interface configuration command. This command binds the physical and logical ports together. For more information, see Chapter 30, “Configuring EtherChannels.”

### Connecting Interfaces

Devices within a single VLAN can communicate directly through any switch. Ports in different VLANs cannot exchange data without going through a routing device or routed interface.

With a standard Layer 2 switch, ports in different VLANs have to exchange information through a router. In the configuration shown in Figure 10-1, when Host A in VLAN 20 sends data to Host B in VLAN 30, it must go from Host A to the switch, to the router, back to the switch, and then to Host B.

**Figure 10-1   Connecting VLANs with Layer 2 Switches**

---

### Using the Interface Command

To configure a physical interface (port), use the `interface` global configuration command to enter interface configuration mode and to specify the interface type, slot, and number.

- **Type**—Fast Ethernet (fastethernet or fa) for 10/100 Ethernet, Gigabit Ethernet (gigabitethernet or gi), or LRE (longreachethernet or lo).
- **Slot**—The slot number on the switch (always 0 on this switch).
- **Port number**—The interface number on the switch. The port numbers always begin at 1, starting with the leftmost port when facing the front of the switch, for example, fastethernet0/1, fastethernet0/2. If there is more than one interface type (for example, 10/100 ports and Gigabit Ethernet ports), the port number restarts with the second interface type: gigabitethernet0/1, gigabitethernet0/2.
You can identify physical interfaces by physically checking the interface location on the switch. You can also use the Cisco IOS show privileged EXEC commands to display information about a specific interface or all the interfaces on the switch. The remainder of this chapter primarily provides physical interface configuration procedures.

This section describes how to configure all types of interfaces and how to configure a range of interfaces:

- Procedures for Configuring Interfaces, page 10-5
- Configuring a Range of Interfaces, page 10-5
- Configuring and Using Interface-Range Macros, page 10-7

### Procedures for Configuring Interfaces

These general instructions apply to all interface configuration processes.

#### Step 1
Enter the `configure terminal` command at the privileged EXEC prompt:

```
Switch# configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

```
Switch(config)#
```

#### Step 2
Enter the `interface` global configuration command. Identify the interface type and the number of the connector. In this example, Gigabit Ethernet interface 0/1 is selected:

```
Switch(config)# interface gigabitethernet0/1
```

Note: You do not need to add a space between the interface type and interface number. For example, in the preceding line, you can specify either `gigabitethernet 0/1`, `gigabitethernet0/1`, `gi 0/1`, or `gi0/1`.

#### Step 3
Follow each `interface` command with the interface configuration commands your particular interface requires. The commands you enter define the protocols and applications that will run on the interface. The commands are collected and applied to the interface when you enter another interface command or enter `end` to return to privileged EXEC mode.

You can also configure a range of interfaces by using the `interface range` or `interface range macro` global configuration commands. Interfaces configured in a range must be the same type and must be configured with the same feature options.

#### Step 4
After you configure an interface, verify its status by using the `show` privileged EXEC commands listed in the “Monitoring and Maintaining the Interfaces” section on page 10-15.

Enter the `show interfaces` privileged EXEC command to see a list of all interfaces on or configured for the switch. A report is provided for each interface that the device supports or for the specified interface.

### Configuring a Range of Interfaces

You can use the `interface range` global configuration command to configure multiple interfaces with the same configuration parameters. When you enter the interface-range configuration mode, all command parameters that you enter are attributed to all interfaces within that range until you exit this mode.
Beginning in privileged EXEC mode, follow these steps to configure a range of interfaces with the same parameters:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface range {port-range</td>
<td>macro macro_name}</td>
</tr>
<tr>
<td></td>
<td>• You can use the interface range command to configure up to five port ranges or a previously defined macro.</td>
</tr>
<tr>
<td></td>
<td>• The macro variable is explained in the “Configuring and Using Interface-Range Macros” section on page 10-7.</td>
</tr>
<tr>
<td></td>
<td>• Each comma-separated port-range must consist of the same port type. You do not need to enter spaces before or after the comma.</td>
</tr>
<tr>
<td></td>
<td>• When you define a range, the space between the first port and the hyphen is required.</td>
</tr>
<tr>
<td>Step 3</td>
<td>You can now use the normal configuration commands to apply the configuration parameters to all interfaces in the range.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show interfaces [interface-id]</td>
<td>Verify the configuration of the interfaces in the range.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

When using the interface range global configuration command, note these guidelines:

- Valid entries for port-range:
  - `vlan vlan-ID - vlan-ID`, where VLAN ID is from 1 to 1005 with the SI installed or 1 to 4094 with the EI installed
  - `fastethernet slot/{first port} - {last port}`, where slot is 0
  - `gigabitethernet slot/{first port} - {last port}`, where slot is 0
  - `longreachethernet slot/{first port} - {last port}`, where slot is 0
  - `port-channel port-channel-number - port-channel-number`, where port-channel-number is from 1 to 6

- You must add a space between the interface numbers and the hyphen when using the interface range command. For example, the command `interface range fastethernet0/1 - 5` is a valid range; the command `interface range fastethernet0/1-5` is not a valid range.

- The interface range command works only with VLAN interfaces that have been configured with the interface vlan command (the show running-config privileged EXEC command output shows the configured VLAN interfaces). VLAN interfaces that do not appear by using the show running-config command cannot be used with the interface range command.

- All interfaces in a range must be the same type; that is, all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or VLAN interfaces.

This example shows how to use the interface range global configuration command to set the speed on Fast Ethernet interfaces 0/1 to 0/5 to 100 Mbps:

Switch# configure terminal
Switch(config)# interface range fastethernet0/1 - 5
Switch(config-if-range)# speed 100
Chapter 10 Configuring Interface Characteristics

Using the Interface Command

This example shows how to use a comma to add different interface type strings to the range to enable all Fast Ethernet interfaces in the range 0/1 to 0/3 and Gigabit Ethernet interfaces 0/1 and 0/2:

Switch# configure terminal
Switch(config)# interface range fastethernet0/1 - 3, gigabitethernet0/1 - 2
Switch(config-if-range)# no shutdown

If you enter multiple configuration commands while you are in interface-range mode, each command is executed as it is entered. The commands are not batched together and executed after you exit interface-range mode. If you exit interface-range configuration mode while the commands are being executed, some commands might not be executed on all interfaces in the range. Wait until the command prompt reappears before exiting interface-range configuration mode.

Configuring and Using Interface-Range Macros

You can create an interface-range macro to automatically select a range of interfaces for configuration. Before you can use the macro keyword in the interface range macro global configuration command string, you must use the define interface-range global configuration command to define the macro.

Beginning in privileged EXEC mode, follow these steps to define an interface-range macro:

1. Configure terminal
   - Enter global configuration mode.

2. Define interface-range macro_name
   - Define the interface-range macro, and save it in NVRAM.
   - The macro_name is a 32-character maximum character string.
   - A macro can contain up to five comma-separated interface ranges. You do not need to enter spaces before or after the comma.
   - Each interface-range must consist of the same port type.

3. Interface range macro macro_name
   - Select the interface range to be configured by using the values saved in the interface-range macro called macro_name.
   - You can now use the normal configuration commands to apply the configuration to all interfaces in the defined macro.

4. End
   - Return to privileged EXEC mode.

5. Show running-config | include define
   - Show the defined interface-range macro configuration.

6. Copy running-config startup-config
   - (Optional) Save your entries in the configuration file.

Use the no define interface-range macro_name global configuration command to delete a macro.

When using the define interface-range global configuration command, note these guidelines:

- Valid entries for interface-range:
  - `vlan vlan-ID - vlan-ID`, where VLAN ID is from 1 to 1005 with the SI installed or 1 to 4094 with the EI installed
  - `fastethernet slot/{first port} - {last port}`, where slot is 0
  - `gigabitethernet slot/{first port} - {last port}`, where slot is 0
  - `longreachethernet slot/{first port} - {last port}`, where slot is 0
Chapter 10  Configuring Interface Characteristics

Configuring Ethernet Interfaces

The switch supports these interface types:

- Physical ports—Switch ports, including access and trunk ports
- Port channels—EtherChannel of interfaces
- VLANs

These sections describe the default interface configuration and the optional features that you can configure on most physical interfaces:

- Default Ethernet Interface Configuration, page 10-9
- Configuring Interface Speed and Duplex Mode, page 10-10
Default Ethernet Interface Configuration

Table 10-1 shows the Ethernet interface default configuration. For more details on the VLAN parameters listed in the table, see Chapter 16, “Configuring VLANs.” For details on controlling traffic to the port, see Chapter 21, “Configuring Port-Based Traffic Control.”

Chapter 10  Configuring Interface Characteristics

Configuring Interface Speed and Duplex Mode

The 10/100 Ethernet interfaces on a non-LRE switch operate in 10 or 100 Mbps and in either full- or half-duplex mode. The 10/100/1000 Ethernet interfaces on Catalyst 2950 LRE, Catalyst 2950T-24, Catalyst 2950T-48-SI, and Catalyst 2955T-24 switches operate at 10 or 100 Mbps in either full- or half-duplex mode or at 1000 Mbps only in full-duplex mode. The fiber-optic SFP-module ports on the LRE switch operate only at 1000 Mbps in full-duplex mode.

In full-duplex mode, two stations can send and receive at the same time. When packets can flow in both directions simultaneously, effective Ethernet bandwidth doubles to 20 Mbps for 10-Mbps interfaces, to 200 Mbps for Fast Ethernet interfaces, and to 2 Gbps for Gigabit Ethernet interfaces. Full-duplex communication is often an effective solution to collisions, which are major constrictions in Ethernet networks. Normally, 10-Mbps ports operate in half-duplex mode, which means that stations can either receive or send.

You can configure interface speed on the Fast Ethernet (10/100-Mbps), Gigabit Ethernet (10/100/1000 Mbps), and LRE interfaces. You cannot configure speed on the 100BASE-FX, 1000BASE-SX, GBIC-module, and SFP-module interfaces.

You can configure duplex mode on any Fast Ethernet interfaces that are not set to autonegotiate. You can configure duplex mode on the 10/100/1000 ports on the Catalyst 2950 LRE, Catalyst 2950T-24, Catalyst 2950T-48-SI, and Catalyst 2955T-24 switches but cannot configure duplex mode on these interfaces:

- 100BASE-FX ports on the Catalyst 2950C-24 switch
- 1000BASE-SX ports on the Catalyst 2950SX-24 switch
- 1000BASE-SX ports on the Catalyst 2950SX-48-SI switch
- GBIC ports
- Fiber-optic SFP-module ports on the Catalyst 2950 LRE switch

Note

You cannot configure speed or duplex mode on GBIC ports, but for certain types of GBICs, you can configure speed to not negotiate (nongotiate) if connected to a device that does not support autonegotiation.

These sections describe how to configure the interface speed and duplex mode:

- Configuration Guidelines, page 10-10
- Setting the Interface Speed and Duplex Parameters on a Non-LRE Switch Port, page 10-12
- Adding a Description for an Interface, page 10-14

For information about configuring the CPE 10/100 port speed and duplex mode, see the “Ports on the Catalyst 2950 LRE Switches” section on page 12-1 and the “CPE Ethernet Link Guidelines” section on page 12-10.

Configuration Guidelines

When configuring an interface speed and duplex mode, note these guidelines:

- Ethernet ports set to 1000 Mbps should always be set to full duplex.
- A Gigabit Ethernet port that does not match the settings of an attached device can lose connectivity and does not generate statistics.
- If both ends of the line support autonegotiation, we highly recommend the default setting of auto.
When connecting an interface to a 100BASE-T device that does not autonegotiate, set the speed to a nonautonegotiation value (for example, nonegotiate), and set the duplex mode to full or half to match the device. The speed value and duplex mode must be explicitly set.

When connecting an interface to a Gigabit Ethernet device that does not autonegotiate, disable autonegotiation on the switch, and set the duplex and flow control parameters to be compatible with the remote device.

100BASE-FX ports operate only at 100 Mbps and in full-duplex mode.

1000BASE-SX ports operate only at 1000 Mbps and in full-duplex mode.

1000BASE-T GBICs operate only at 1000 Mbps and in full-duplex mode.

You can configure the 10/100/1000 ports on the Catalyst 2950T-24 and Catalyst 2950T-48-SI switches to autonegotiate the duplex mode by using the `duplex auto` interface configuration command, or you can manually set the duplex mode to full by using the `duplex full` command.

The 10/100/1000 ports on the Catalyst 2950T-24 switches operate only in full-duplex mode. The ports do not support the `half` keyword in the `duplex` command.

The 10/100/1000 ports on the Catalyst 2950T-48-SI switches support the `half` keyword when the interface speed is 10 or 100 Mbps.

10/100/1000 ports on the Catalyst 2950 LRE or the Catalyst 2955T-12 switch can operate at 10 or 100 Mbps in either half- or full-duplex mode. The ports can operate at 1000 Mbps only in full-duplex mode.

Fiber-optic SFP-module ports on the Catalyst 2950 LRE switch operate only at 1000 Mbps in full-duplex mode.

GigaStack-to-GigaStack cascade connections operate in half-duplex mode, and GigaStack-to-GigaStack point-to-point connections operate in full-duplex mode.

When Spanning Tree Protocol (STP) is enabled and a port is reconfigured, the switch can take up to 30 seconds to check for loops. The port LED is amber while STP reconfigures.

On the 10/100/1000 ports on an LRE switch, use the `speed` and `duplex` interface commands. You cannot configure the speed and duplex settings on the fiber-optic SFP-module ports.

For example, if you enter the `speed 100` and the `duplex half` interface configuration commands and the fiber-optic SFP-module port is active, the switch attempts to autonegotiate the speed and duplex settings as 1000 Mbps with full autonegotiation.

If you enter the `speed 100` and the `duplex half` interface configuration commands and the 10/100/1000 port is active, the switch advertises the speed and duplex settings as 10 Mbps and half duplex.

On the LRE ports on an LRE switch, use the `local speed` and the `local duplex` interface configuration commands.

⚠️ **Caution**

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.
### Setting the Interface Speed and Duplex Parameters on a Non-LRE Switch Port

Beginning in privileged EXEC mode, follow these steps to set the speed and duplex mode for a physical interface on a non-LRE switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Enter interface configuration mode and the physical interface identification.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>speed {10</td>
<td>100</td>
</tr>
<tr>
<td>duplex {auto</td>
<td>full</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>show interfaces interface-id</td>
<td>Display the interface speed and duplex mode configuration.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no speed and no duplex interface configuration commands to return the interface to the default speed and duplex settings (autonegotiate). To return all interface settings to the defaults, use the default interface interface-id interface configuration command.

This example shows how to set the interface speed to 10 Mbps and the duplex mode to half on a port:

```
Switch# configure terminal
Switch(config)# interface fastethernet0/3
Switch(config-if)# speed 10
Switch(config-if)# duplex half
Switch(config)# end
```

### Setting the Interface Speed and Duplex Parameters on an LRE Switch Port

Beginning in privileged EXEC mode, follow these steps to set the speed and duplex mode for an LRE interface on an LRE switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Enter interface configuration mode and the physical interface identification.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>local speed {10</td>
<td>100}</td>
</tr>
</tbody>
</table>

**Note** The local command is not available on GBIC ports.
Configuring Ethernet Interfaces

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4</td>
<td>local duplex {full</td>
</tr>
<tr>
<td>Step 5</td>
<td>end Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>show running-config Display the LRE interface speed and duplex mode configuration.</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no local speed and no local duplex interface configuration commands to return the interface to the default speed and duplex settings. To return all interface settings to the defaults, use the default interface interface-id interface configuration command.

Configuring Media Types for Gigabit Ethernet Interfaces on LRE Switches

On the LRE switches, use the media-type interface configuration command to configure the media type for Gigabit Ethernet interfaces. You can enable or disable fiber-optic or copper (10/100/1000) connections. You can also manually set the port to select an SFP connector or an RJ45 connector. Use the no form of this command to return to the default setting of SFP-preferred. To configure media types, use the media-type {auto-select | rj45 | sfp} interface configuration command.

For more information, see the command reference for this release.

Configuring IEEE 802.3x Flow Control on IEEE 802.3z Gigabit Ethernet Ports

Flow control is supported only on the 10/100/1000, 1000BASE-SX, GBIC-module, and SFP-module ports. Flow control enables connected Gigabit Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port to stop sending until the condition clears. When the local device detects any congestion at its end, it can notify the link partner or the remote device of the congestion by sending a pause frame. Upon receipt of a pause frame, the remote device stops sending any data packets, which prevents any loss of data packets during the congestion period.

We strongly recommend that you do not configure IEEE 802.3z flow control when quality of service (QoS) is configured on the switch. Before configuring flow control on an interface, make sure to return to the default QoS settings listed in the “Default Standard QoS Configuration” section on page 29-17.

Flow control can be implemented in two forms, symmetric and asymmetric. The symmetric implementation is suitable for point-to-point links, and asymmetric is suitable for hub-to-end node connections, where it is desirable for the hub to pause the end system, but not vice-versa. You use the flowcontrol interface configuration command to set the interface’s ability to receive and send pause frames to on, off, or desired. The default flow control state for Gigabit Ethernet ports is receive off and send desired.

These rules apply to flow control settings on the device:

- receive on (or desired) and send on: Flow control operates in both directions; both the local and the remote devices can send pause frames to show link congestion.
- receive on (or desired) and send desired: The port can receive pause frames and can send pause frames if the attached device supports flow control.
• **receive on** (or **desired**) and **send off**: The port cannot send pause frames but can operate with an attached device that is required to or can send pause frames; the port can receive pause frames.

• **receive off** and **send on**: The port sends pause frames if the remote device supports flow control but cannot receive pause frames from the remote device.

• **receive off** and **send desired**: The port cannot receive pause frames but can send pause frames if the attached device supports flow control.

• **receive off** and **send off**: Flow control does not operate in either direction. In case of congestion, no indication is given to the link partner, and no pause frames are sent or received by either device.

**Note**

For details about the command settings and the resulting flow control resolution on local and remote ports, see the `flowcontrol` interface configuration command in the command reference for this release.

Beginning in privileged EXEC mode, follow these steps to configure flow control on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>interface interface-id</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>`flowcontrol {receive</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>show interfaces interface-id</strong></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>copy running-config startup-config</strong></td>
</tr>
</tbody>
</table>

To disable flow control, use the `flowcontrol receive off` and `flowcontrol send off` interface configuration commands.

This example shows how to turn off all flow control on a port and to display the results:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# flowcontrol receive off
Switch(config-if)# flowcontrol send off
Switch(config-if)# end
Switch# show running-config
```

### Adding a Description for an Interface

You can add a description about an interface to help you remember its function. The description appears in the output of these commands: `show configuration`, `show running-config`, and `show interfaces`.

Beginning in privileged EXEC mode, follow these steps to add a description for an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>interface interface-id</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>description string</code></td>
</tr>
</tbody>
</table>

```
```
Use the **no description** interface configuration command to delete the description.

This example shows how to add a description on a port and to verify the description:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet0/4
Switch(config-if)# description Connects to Marketing
Switch(config-if)# end
Switch#
```

**Monitoring and Maintaining the Interfaces**

You can perform the tasks in these sections to monitor and maintain interfaces:

- Monitoring Interface and Controller Status, page 10-16
- Clearing and Resetting Interfaces and Counters, page 10-16
- Shutting Down and Restarting the Interface, page 10-17
Monitors and Maintaining the Interfaces

Chapter 10 Configuring Interface Characteristics

Monitoring Interface and Controller Status

Commands entered at the privileged EXEC prompt display information about the interface, including the version of the software and the hardware, the controller status, and statistics about the interfaces. Table 10-2 lists some of these interface monitoring commands. (You can display the full list of show commands by using the show ? command at the privileged EXEC prompt.) These commands are fully described in the Cisco IOS Interface Command Reference for Cisco IOS Release 12.1.

Table 10-2 show Commands for Interfaces

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces [interface-id]</code></td>
<td>Display the status and configuration of all interfaces or a specific interface.</td>
</tr>
<tr>
<td><code>show interfaces [interface-id] capabilities [module {module-number}]]</code></td>
<td>Display the capabilities of an interface. The module number is always 0. If you enter an interface ID, the module keyword is not visible.</td>
</tr>
<tr>
<td><code>show interfaces interface-id status [err-disabled]</code></td>
<td>Display interface status or a list of interfaces in error-disabled state.</td>
</tr>
<tr>
<td><code>show interfaces [interface-id] switchport</code></td>
<td>Display administrative and operational status of switching (nonrouting) ports.</td>
</tr>
<tr>
<td><code>show interfaces [interface-id] description</code></td>
<td>Display the description configured on an interface or all interfaces and the interface status.</td>
</tr>
<tr>
<td><code>show ip interface [interface-id]</code></td>
<td>Display the usability status of all interfaces configured for IP or the specified interface.</td>
</tr>
<tr>
<td><code>show interfaces transceiver properties</code></td>
<td>(Optional) Display speed and duplex settings on the interface.</td>
</tr>
<tr>
<td><code>show running-config interface [interface-id]</code></td>
<td>Display the running configuration in RAM for the interface.</td>
</tr>
<tr>
<td><code>show version</code></td>
<td>Display the hardware configuration, software version, the names and sources of configuration files, and the boot images.</td>
</tr>
</tbody>
</table>

For examples of the output from these commands, see the command reference for this release and the Cisco IOS Interface Command Reference for Cisco IOS Release 12.1.

If you enter the `show interfaces interfaces-id` privileged EXEC command on a LRE switch interface, the command output shows the statistics for the LRE interface. It does not show the statistics for the 10/100 Ethernet ports on the attached CPE device. The output also shows that the speed and duplex settings of the LRE interface are never autonegotiated but are always forced (in other words, the speed and duplex settings will be 100 Mbps and half duplex, 100 Mbps and full duplex, 10 Mbps and half duplex, or 10 Mbps and full duplex).

Clearing and Resetting Interfaces and Counters

Table 10-3 lists the privileged EXEC mode `clear` commands that you can use to clear counters and reset interfaces.

Table 10-3 Clear Commands for Interfaces

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear counters [interface-id]</code></td>
<td>Clear interface counters.</td>
</tr>
</tbody>
</table>
To clear the interface counters shown by the `show interfaces` privileged EXEC command, use the `clear counters` privileged EXEC command. The `clear counters` command clears all current interface counters from the interface unless optional arguments are specified to clear only a specific interface type from a specific interface number.

```
Note
The `clear counters` privileged EXEC command does not clear counters retrieved by using Simple Network Management Protocol (SNMP), but only those seen with the `show interfaces` privileged EXEC command output.
```

This example shows how to clear and reset the counters on a port:

```
Switch# clear counters fastethernet0/5
Clear "show interface" counters on this interface [confirm] y
Switch# *
Sep 30 08:42:55: %CLEAR-5-COUNTERS: Clear counter on interface FastEthernet0/5 by vty1 (171.69.115.10)
```

Use the `clear interface` or `clear line` privileged EXEC command to clear and reset an interface or serial line. Under most circumstances, you do not need to clear the hardware logic on interfaces or serial lines.

```
This example shows how to clear and reset a port:
Switch# clear interface fastethernet0/5
```

### Shutting Down and Restarting the Interface

Shutting down an interface disables all functions on the specified interface and marks the interface as unavailable on all monitoring command displays. This information is communicated to other network servers through all dynamic routing protocols. The interface is not mentioned in any routing updates.

Beginning in privileged EXEC mode, follow these steps to shut down an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface {vlan vlan-id}</td>
<td>Select the interface to be configured.</td>
</tr>
<tr>
<td><strong>Step 3</strong> shutdown</td>
<td>Shut down an interface.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verify your entry.</td>
</tr>
</tbody>
</table>

Use the `no shutdown` interface configuration command to restart the interface.
When the `shutdown` interface configuration command is entered on an LRE interface, the LRE link is shut down. To shut down the 10/100 Ethernet ports on CPE device, use the `cpe shutdown [port port-id]` interface configuration command.

This example shows how to shut down a port:

```
Switch# configure terminal
Switch(config)# interface fastethernet0/5
Switch(config-if)# shutdown
Switch(config-if)#
*Sep 30 08:33:47: %LINK-5-CHANGED: Interface FastEthernet0/5, changed state to a administratively down
```

This example shows how to re-enable a port:

```
Switch# configure terminal
Switch(config)# interface fastethernet0/5
Switch(config-if)# no shutdown
Switch(config-if)#
*Sep 30 08:36:00: %LINK-3-UPDOWN: Interface FastEthernet0/5, changed state to up
```

To verify that an interface is disabled, enter the `show interfaces` privileged EXEC command. A disabled interface appears as `administratively down` in the `show interfaces` command output.
Configuring Smartports Macros

This chapter describes how to configure and apply Smartports macros on the Catalyst 2950 switch.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Understanding Smartports Macros, page 11-1
- Configuring Smartports Macros, page 11-2
- Displaying Smartports Macros, page 11-8

Understanding Smartports Macros

Smartports macros provide a convenient way to save and share common configurations. You can use Smartports macros to enable features and settings based on the location of a switch in the network and for mass configuration deployments across the network.

Each Smartports macro is a set of CLI commands that you define. Smartports macros do not contain new CLI commands; they are simply a group of existing CLI commands.

When you apply a Smartports macro on an interface, the CLI commands within the macro are configured on the interface. When the macro is applied to an interface, the existing interface configurations are not lost. The new commands are added to the interface and are saved in the running configuration file.

There are Cisco-default Smartports macros embedded in the switch software (see Table 11-1). You can display these macros and the commands they contain by using the `show parser macro` user EXEC command.

<table>
<thead>
<tr>
<th>Table 11-1</th>
<th>Cisco-Default Smartports Macros</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Macro Name¹</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>cisco-global</td>
<td>Use this global configuration macro to enable load balancing across VLANs, provide rapid convergence of spanning-tree instances and to enable port error recovery.</td>
</tr>
<tr>
<td>cisco-desktop</td>
<td>Use this interface configuration macro for increased network security and reliability when connecting a desktop device, such as a PC, to a switch port.</td>
</tr>
</tbody>
</table>
Cisco also provides a collection of pretested, Cisco-recommended baseline configuration templates for Catalyst switches. The online reference guide templates provide the CLI commands that you can use to create Smartports macros based on the usage of the port. You can use the configuration templates to create Smartports macros to build and deploy Cisco-recommended network designs and configurations. For more information about Cisco-recommended configuration templates, see this Smartports website: http://www.cisco.com/go/smartports

<table>
<thead>
<tr>
<th>Macro Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cisco-phone</td>
<td>Use this interface configuration macro when connecting a desktop device such as a PC with a Cisco IP Phone to a switch port. This macro is an extension of the cisco-desktop macro and provides the same security and resiliency features, but with the addition of dedicated voice VLANs to ensure proper treatment of delay-sensitive voice traffic.</td>
</tr>
<tr>
<td>cisco-switch</td>
<td>Use this interface configuration macro when connecting an access switch and a distribution switch or between access switches connected using GigaStack modules or GBICs.</td>
</tr>
<tr>
<td>cisco-router</td>
<td>Use this interface configuration macro when connecting the switch and a WAN router.</td>
</tr>
<tr>
<td>cisco-lre-cpe</td>
<td>Use this interface configuration macro to optimize performance when the switch is installed in apartment buildings or hotels, or when it is used to deliver Video-on-Demand (VoD), or multicast video.</td>
</tr>
<tr>
<td>cisco-wireless</td>
<td>Use this interface configuration macro when connecting the switch and a wireless access point.</td>
</tr>
</tbody>
</table>

1. Cisco-default Smartports macros vary depending on the software version running on your switch.

Cisco also provides a collection of pretested, Cisco-recommended baseline configuration templates for Catalyst switches. The online reference guide templates provide the CLI commands that you can use to create Smartports macros based on the usage of the port. You can use the configuration templates to create Smartports macros to build and deploy Cisco-recommended network designs and configurations. For more information about Cisco-recommended configuration templates, see this Smartports website: http://www.cisco.com/go/smartports

### Configuring Smartports Macros

You can create a new Smartports macro or use an existing macro as a template to create a new macro that is specific to your application. After you create the macro, you can apply it globally to a switch or to a switch interface or range of interfaces.

This section includes information about:

- Default Smartports Macro Configuration, page 11-2
- Smartports Macro Configuration Guidelines, page 11-3
- Creating Smartports Macros, page 11-4
- Applying Smartports Macros, page 11-5
- Applying Cisco-Default Smartports Macros, page 11-6

### Default Smartports Macro Configuration

There are no Smartports macros enabled.
Smartports Macro Configuration Guidelines

Follow these guidelines when configuring macros on your switch:

- When creating a macro, do not use the `exit` or `end` commands or change the command mode by using `interface interface-id`. This could cause commands that follow `exit, end, or interface interface-id` to execute in a different command mode.
- When creating a macro, all CLI commands should be in the same configuration mode.
- When creating a macro that requires the assignment of unique values, use the `parameter value` keywords to designate values specific to the interface. Keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value. Any full match of a keyword, even if it is part of a larger string, is considered a match and is replaced by the corresponding value.
- Macro names are case sensitive. For example, the commands `macro name Sample-Macro` and `macro name sample-macro` will result in two separate macros.
- Some macros might contain keywords that require a parameter value. You can use the `macro global apply macro-name ?` global configuration command or the `macro apply macro-name ? interface` configuration command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.
- When a macro is applied globally to a switch or to a switch interface, all existing configuration on the interface is retained. This is helpful when applying an incremental configuration.
- If you modify a macro definition by adding or deleting commands, the changes are not reflected on the interface where the original macro was applied. You need to reapply the updated macro on the interface to apply the new or changed commands.
- You can use the `macro global trace macro-name` global configuration command or the `macro trace macro-name` interface configuration command to apply and debug a macro to find any syntax or configuration errors. If a command fails because of a syntax error or a configuration error, the macro continues to apply the remaining commands.
- Some CLI commands are specific to certain interface types. If a macro is applied to an interface that does not accept the configuration, the macro will fail the syntax check or the configuration check, and the switch will return an error message.
- Applying a macro to an interface range is the same as applying a macro to a single interface. When you use an interface range, the macro is applied sequentially to each interface within the range. If a macro command fails on one interface, it is still applied to the remaining interfaces.
- When you apply a macro to a switch or a switch interface, the macro name is automatically added to the switch or interface. You can display the applied commands and macro names by using the `show running-config` user EXEC command.

There are Cisco-default Smartports macros embedded in the switch software. You can display these macros and the commands they contain by using the `show parser macro` user EXEC command.

Follow these guidelines when you apply a Cisco-default Smartports macro on an interface:

- Display all macros on the switch by using the `show parser macro` user EXEC command. Display the contents of a specific macro by using the `show parser macro name macro-name` user EXEC command.
- Keywords that begin with `$` mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the `parameter value` keywords.

The Cisco-default macros use the `$` character to help identify required keywords. There is no restriction on using the `$` character to define keywords when you create a macro.
Creating Smartports Macros

Beginning in privileged EXEC mode, follow these steps to create a Smartports macro:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>macro name macro-name</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show parser macro name macro-name</td>
</tr>
</tbody>
</table>

The no form of the macro name global configuration command only deletes the macro definition. It does not affect the configuration of those interfaces on which the macro is already applied. This example shows how to create a macro that defines the switchport access VLAN and the number of secure MAC addresses and also includes two help string keywords by using # macro keywords:

```
Switch(config)# macro name test
switchport access vlan $VLANID
switchport port-security maximum $MAX
#macro keywords $VLANID $MAX
@
```
## Applying Smartports Macros

Beginning in privileged EXEC mode, follow these steps to apply a Smartports macro:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;macro global (apply</td>
<td>trace)\n\nmacro-name [parameter {value}] [parameter {value}] [parameter {value}]</td>
</tr>
<tr>
<td><strong>Step 3</strong>&lt;br&gt;macro global description text</td>
<td>(Optional) Enter a description about the macro that is applied to the switch.</td>
</tr>
<tr>
<td><strong>Step 4</strong>&lt;br&gt;interface interface-id</td>
<td>(Optional) Enter interface configuration mode, and specify the interface on which to apply the macro.</td>
</tr>
<tr>
<td><strong>Step 5</strong>&lt;br&gt;default interface interface-id</td>
<td>(Optional) Clear all configuration from the specified interface.</td>
</tr>
<tr>
<td><strong>Step 6</strong>&lt;br&gt;macro (apply</td>
<td>trace) macro-name [parameter {value}] [parameter {value}] [parameter {value}]</td>
</tr>
<tr>
<td><strong>Step 7</strong>&lt;br&gt;macro description text</td>
<td>(Optional) Enter a description about the macro that is applied to the interface.</td>
</tr>
<tr>
<td><strong>Step 8</strong>&lt;br&gt;end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 9</strong>&lt;br&gt;show parser macro description [interface interface-id]</td>
<td>Verify that the macro is applied to the interface.</td>
</tr>
<tr>
<td><strong>Step 10</strong>&lt;br&gt;copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

You can delete a global macro-applied configuration on a switch only by entering the no version of each command that is in the macro. You can delete a macro-applied configuration on an interface by entering the default interface interface-id interface configuration command.
This example shows how to apply the user-created macro called `snmp`, to set the host name address to `test-server` and to set the IP precedence value to 7:

```
Switch(config)# macro global apply snmp ADDRESS test-server VALUE 7
```

This example shows how to debug the user-created macro called `snmp` by using the `macro global trace` global configuration command to find any syntax or configuration errors in the macro when it is applied to the switch.

```
Switch(config)# macro global trace snmp VALUE 7
Applying command...'snmp-server enable traps port-security'
Applying command...'snmp-server enable traps linkup'
Applying command...'snmp-server enable traps linkdown'
Applying command...'snmp-server host'
%Error Unknown error.
Applying command...'snmp-server ip precedence 7'
```

This example shows how to apply the user-created macro called `desktop-config` and to verify the configuration.

```
Switch(config)# interface fastethernet0/2
Switch(config-if)# macro apply desktop-config
Switch(config-if)# end
Switch# show parser macro description
```

```
<table>
<thead>
<tr>
<th>Interface</th>
<th>Macro Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi0/2</td>
<td>desktop-config</td>
</tr>
</tbody>
</table>
```

This example shows how to apply the user-created macro called `desktop-config` and to replace all occurrences of VLAN 1 with VLAN 25:

```
Switch(config-if)# macro apply desktop-config vlan 25
```

### Applying Cisco-Default Smartports Macros

Beginning in privileged EXEC mode, follow these steps to apply a Smartports macro:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>show parser macro</td>
</tr>
<tr>
<td>Step 2</td>
<td>show parser macro name <code>macro-name</code></td>
</tr>
<tr>
<td>Step 3</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 4</td>
<td>`macro global [apply</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>interface interface-id</code></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>default interface interface-id</code></td>
</tr>
</tbody>
</table>
### Chapter 11  Configuring Smartports Macros

#### Configuring Smartports Macros

You can delete a global macro-applied configuration on a switch only by entering the `no` version of each command that is in the macro. You can delete a macro-applied configuration on an interface by entering the `default interface interface-id` interface configuration command.

This example shows how to display the `cisco-desktop` macro, how to apply the macro, and to set the access VLAN ID to 25 on an interface:

```
Switch# show parser macro cisco-desktop
--------------------------------------------------------------
Macro name : cisco-desktop
Macro type : default

# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID
switchport mode access

# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
switchport port-security maximum 1

# Ensure port-security age is greater than one minute
# and use inactivity timer
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity

# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable

--------------------------------------------------------------
Switch# configure terminal
Switch(config)# fastethernet0/4
Switch(config-if)# macro apply cisco-desktop $AVID 25
```

**Step 7**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`macro {apply</td>
<td>trace} macro-name [parameter {value}] [parameter {value}] [parameter {value}]`</td>
</tr>
</tbody>
</table>

**Step 8**

- `end`  
  Return to privileged EXEC mode.

**Step 9**

- `show running-config interface interface-id`  
  Verify that the macro is applied to an interface.

**Step 10**

- `copy running-config startup-config`  
  (Optional) Save your entries in the configuration file.

You can delete a global macro-applied configuration on a switch only by entering the `no` version of each command that is in the macro. You can delete a macro-applied configuration on an interface by entering the `default interface interface-id` interface configuration command.

```
Step 7 macro {apply | trace} macro-name [parameter {value}] [parameter {value}] [parameter {value}]

Step 8 end

Step 9 show running-config interface interface-id

Step 10 copy running-config startup-config
```

**Command Purpose**

- `show parser macro cisco-desktop`  
  Display the `cisco-desktop` macro.

- `macro apply cisco-desktop $AVID 25`  
  Apply the `cisco-desktop` macro to the interface with the access VLAN ID set to 25.

- `copy running-config startup-config`  
  Save the configuration to the startup configuration file.
Displaying Smartports Macros

To display the Smartports macros, use one or more of the privileged EXEC commands in Table 11-2.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show parser macro</td>
<td>Displays all configured macros.</td>
</tr>
<tr>
<td>show parser macro name macro-name</td>
<td>Displays a specific macro.</td>
</tr>
<tr>
<td>show parser macro brief</td>
<td>Displays the configured macro names.</td>
</tr>
<tr>
<td>show parser macro description [interface interface-id]</td>
<td>Displays the macro description for all interfaces or for a specified interface.</td>
</tr>
</tbody>
</table>
Configuring LRE

This chapter describes how to configure the Long-Reach Ethernet (LRE) features on your Catalyst 2950 LRE switch. This chapter consists of these sections:

- Understanding LRE Features, page 12-1
- Configuring LRE Ports, page 12-8
- Upgrading LRE Switch Firmware, page 12-23
- Displaying LRE Status, page 12-27

Note

For complete syntax and usage information for the commands used in this chapter, see the switch command reference for this release and the Cisco IOS Interface Command Reference for Cisco IOS Release 12.1.

For information about which Cisco LRE customer premises equipment (CPE) devices are supported by the LRE switches, see Table 1-2 on page 1-2.

Understanding LRE Features

These sections describe LRE features:

- Ports on the Catalyst 2950 LRE Switches, page 12-1
- LRE Links and LRE Profiles, page 12-2
- LRE Message Logging Process, page 12-7

Ports on the Catalyst 2950 LRE Switches

The Catalyst 2950 LRE switches use LRE technology to transfer data, voice, and video traffic over categorized and noncategorized unshielded twisted-pair cable (Category 1, 2, and 3 structured and unstructured cable such as existing telephone lines).

Connecting a switch LRE port to a remote Ethernet device (such as a PC) requires two types of connections:
LRE Links and LRE Profiles

The LRE link settings define the connection between the LRE switch port and the CPE RJ-11 wall port. The LRE link provides symmetric and asymmetric bandwidth for data, voice, and video traffic. Symmetric transmission occurs when the downstream and upstream bandwidths are the same. Asymmetric transmission occurs when the downstream and the upstream bandwidths differ. Downstream transmission refers to the traffic going from the LRE switch to the CPE device. Upstream transmission refers to the traffic going from the CPE device to the LRE switch.

The switch controls upstream and downstream rates on the LRE link by using configurations called profiles. Depending on the profile, the upstream and downstream bands on an LRE link can range from approximately 1 to 18.750 Mbps.

This section discusses these topics:

- LRE Profiles, page 12-2
- LRE Sequences, page 12-5
- CPE Ethernet Links, page 12-6

LRE Profiles

When the LRE switch establishes a link with the CPE device, the switch downloads its profile settings to the CPE device so that the switch and CPE device operate with the same configuration.

The LRE switches are shipped with system-defined profiles. You can configure a profile on a global or per-port basis. By default, all LRE ports on the Catalyst 2950ST-8 LRE and 2950ST-24 LRE switches are enabled with the LRE-10 profile, and all LRE ports on the Catalyst 2950ST-24 LRE 997 switches are enabled with the LRE-6 profile. These default profile allows the upstream and downstream effective data rate on the LRE link to be 10 Mbps and 6.0 Mbps, respectively.

Table 12-1 and Table 12-2 contain the full list of LRE profiles, as well as their downstream and upstream rates (in Mbps and their theoretical upstream and downstream signal-to-noise [SNR] rates in decibels [dB]).
Use the rates and distances in Table 12-1 and Table 12-2 only as guidelines. Factors such as the type of cable that you use, how it is bundled, and the interference and noise on the LRE link can affect the actual LRE link performance. Contact Cisco Systems for information about limitations and optimization of LRE link performance. The downstream and upstream rates in the table are slightly less than the gross data rates shown by the `show controllers lre profile names` privileged EXEC command output.

Understanding LRE Features

Your data rates will always be less than the gross data rate listed in tables. A small percentage of the link rate is used by the Catalyst 2950 LRE switch for supervisory functions with the CPE device connected remotely.

In general, profiles are named for the data rate that you expect to achieve and not the gross data rate as given in the table. All system-defined profiles have the prefix LRE, followed by the downstream user data rate and then the upstream user data rate. If the profile is symmetric, only one data rate is given. The two profiles defined to comply with public frequency usage plans 998 and 997 (LRE-998-15-4 and LRE-997-10-4) are exceptions to this. These two uniquely named profiles also work in any private deployment.

- If you are not using sequences and you have not assigned a profile to an LRE port, the port has a default profile of LRE-10 or LRE-6 (see Table 12-1 and Table 12-2). Port profiles have priority over global profiles. If you assign a global profile to the switch, the switch uses the global profile except on any LRE ports on which a specific profile was assigned.

  When you assign a different profile to a switch LRE port, the port immediately resets and uses the newly assigned profile.

- Use the LL profiles (LRE-5LL, LRE-10LL, and LRE-15LL) on the Catalyst 2950ST-8 LRE and 2950ST-24 LRE switches with care. These profiles have the low-latency (LL) feature enabled and the interleave feature disabled. The LL feature does not delay data transmission, but it makes data more susceptible to interruptions on the LRE link.

  All other profiles have the interleave feature enabled and the LL feature disabled. The interleave feature provides maximum protection against small interruptions on the LRE link but delays data transmission.

  For information on configuring the interleaving delay on the LRE ports, see the “Configuring LRE Interleave” section on page 12-19.

- The symmetric profiles (LRE-5, LRE-10, LRE-15, LRE-8, LRE-7, LRE-4, LRE-3, and LRE-2) on the Catalyst 2950ST-8 LRE and the 2950ST-24 LRE switches provide full-duplex throughput on the link between the LRE switch and CPE device. Under ideal conditions, this can mean up to 30 Mbps of bandwidth on the LRE link if you are using the LRE-15 profile.

</tbody>
</table>
LRE Sequences

The LRE switches are shipped with predefined sequences. Sequences are sets of profiles and are used with the rate selection feature. The rate selection feature enables the switch to automatically select profiles. You can also define your own sets of sequences by using the command-line interface (CLI) commands. For more information, see the “Using Rate Selection to Automatically Assign Profiles” section on page 12-14.

Table 12-3 and Table 12-4 list the predefined sequences for rate selection contained in the software. When executing rate selection, the switch uses a sequence to choose an appropriate profile for a given LRE interface.

</table>
Beginning with the first profile in a sequence, the switch attempts to apply each profile within that sequence to the LRE interface. The switch continues these attempts until it converges (convergence time refers to the time required for the switch to settle on an appropriate profile for the LRE interface). The link is DOWN until a link is established by one of the profiles in the sequence, after which, it is UP.

For additional information on rate selection, see the “Using Rate Selection to Automatically Assign Profiles” section on page 12-14.

**CPE Ethernet Links**

The CPE Ethernet link settings define the connection between the CPE Ethernet port and a remote Ethernet device, such as a PC.

**Note**

From the CLI, you can configure and monitor the Ethernet link on a Cisco 575 LRE CPE and the Cisco 585 LRE CPE. You can configure and monitor the Ethernet link on a Cisco 576 LRE 997 CPE only from the CLI. For information about the switch LEDs, see the Catalyst 2950 Desktop Switch Hardware Installation Guide.

Keep these considerations in mind when you have CPE devices connected to the LRE ports:

- Use the `shutdown` interface configuration command to disable the LRE interface transmitter on any LRE ports. This prevents access to the LRE port and prevents the power emitted from the port from affecting other ports.
- You cannot configure the flow-control setting on the LRE ports. The flow-control setting on the CPE Ethernet port is automatically disabled in half-duplex mode and is automatically enabled in full-duplex mode.
- Certain CPEs do not work with certain switches. For details, see the LRE switch and CPE compatibility matrix (see Table 1-2 on page 1-2). You can connect Cisco 575 LRE CPEs and Cisco 585 LRE CPEs to the Catalyst 2950ST-8 LRE or 2950ST-24 LRE switch. You can connect a Cisco 576 LRE 997 CPE only to a Catalyst 2950ST-24 LRE 997 switch.
- You can hot-swap the CPE devices without powering down the switch or disrupting the other switch ports.
- The CPE toggle feature automatically changes a CPE Ethernet link from down to up if the LRE link comes up in less than 30 seconds. This feature is enabled by default.

CPE toggle cannot be disabled on a Cisco 575 LRE or Cisco 576 LRE 997 CPE link but can be disabled on a Cisco 585 LRE CPE. For more information, see the “Configuring CPE Toggle” section on page 12-21.

Use the `show controllers ethernet-controller` privileged EXEC command to display the internal switch statistics, the statistics collected by the LRE switch interface, and the statistics collected by the LRE CPE interface. For information about this command, see the command reference for this release.

**LRE Link Monitor**

When the link monitor feature is enabled, an LRE switch tracks undesirable or interesting conditions on a link and takes system-defined actions after certain thresholds are reached. The link monitor can track these conditions:

- **SNR, in dB**: The link must have a minimum SNR to function; a higher SNR value means a better noise margin on the link. Links are not established if the SNR is insufficient. For more information, see the “Link Qualification and SNR Margins” section on page 12-16.

- **Reed-Solomon (RS) errors**: The RS Forward Error Correction circuit corrects small bursts of errors so that noise events do not cause Ethernet frame check sequence (FCS) errors. This is implemented in the octal chip as a 32-bit counter. The count resets on read.

- **Transmit (TX) Power, in dBm/Hz**: This is fixed for the switch and adjusts automatically for the CPE device. The local transmit power is always constant and the same for a given profile. The remote transmit power varies according to distance from the switch to the CPE device, with a minimum transmit power of 91.9 dBm/Hz (corresponding to short distances) and a maximum transmit power of –55 dBm/Hz (corresponding to longer cable lengths or greater cable attenuation). The CPE device power can reach its maximum at distances between 1500 feet (450 meters) and 3000 feet (900 meters).

- **Software Controlled Automatic Gain Control (SW AGC Gain), in dBm**: This gives an indirect measure of the received power level. Higher values mean that the receive power is lower (and thus in need of more boost).

- **Link Fail Counts**: The number of times the link failed. A failed link interrupts operation of the Ethernet link for a small number of milliseconds. During this interruption, some packets might be dropped (depending on traffic levels).

- **PMD Freeze Event Counter**: This counts the occurrence of micro-interruption or saturation events. Micro-interruptions and Analog to Digital Converter (ADC) saturations are caused by impulse noise for a short duration. This is implemented in the octal chip as a 8-bit counter.

The link parameters need to be monitored both for the upstream and downstream directions. You can use the information that you get from the link monitor to log events, set traps, change to a lower rate profile, and disable the automatic power back-off feature.

**LRE Message Logging Process**

The Catalyst 2950 LRE switch software monitors switch conditions on a per-port basis and sends the debugging messages to an LRE message logging process that is different than the system message logging process described in Chapter 26, “Configuring System Message Logging.”

These options are available in the LRE logging process:

- **Disabled**—The switch does not log LRE events.
Configuring LRE Ports

These sections describe configuration guidelines and how to assign a profile to all or to individual LRE ports. These sections contain more information about LRE links, ports, and profiles:

- Default LRE Configuration, page 12-8
- Environmental Guidelines for LRE Links, page 12-9
- Guidelines for Using LRE Profiles, page 12-10
- CPE Ethernet Link Guidelines, page 12-10

- Assigning a Profile to a Specific LRE Port, page 12-12 (optional)
- Assigning a Global Sequence to All LRE Ports, page 12-13 (optional)
- Assigning a Sequence to a Specific LRE Port, page 12-13 (optional)
- Using Rate Selection to Automatically Assign Profiles, page 12-14 (optional)
- Configuring LRE Link Persistence, page 12-19 (optional)
- Configuring LRE Link Monitor, page 12-19 (optional)
- Configuring LRE Interleave, page 12-19 (optional)
- Configuring Upstream Power Back-Off, page 12-20 (available only on the Catalyst 2950ST-24 LRE 997 switch) (optional)
- Configuring CPE Toggle, page 12-21 (optional)
- Configuring Syslog Export, page 12-22 (optional)

Default LRE Configuration

This is the default LRE configuration:

- On the Catalyst 2950ST-8 LRE and the Catalyst 2950ST-24 LRE switches, the profile on all LRE ports is LRE-10.
- On the Catalyst 2950ST-24 LRE 997 switches, the profile on all LRE ports is LRE-6.
- Global profiles and global sequences are not assigned to LRE ports.
- Per-port sequences are not assigned to specific LRE ports.
Chapter 12 Configuring LRE

Configuring LRE Ports

- Rate selection is enabled on all interfaces, but a sequence with which to start rate selection is not defined.
- LRE link persistence is enabled. The default is 3 seconds.
- LRE link monitoring is enabled.
- The interleave block size is 16 for non low-latency (LL) profiles and 0 for LL profiles.
- For the upstream power back-off mechanism, the default noise model is the ETSI-E model (available only on the Catalyst 2950ST-24 LRE 997 switch).
- CPE toggle is enabled on a CPE Ethernet link.
- Syslog export is disabled.

Environmental Guidelines for LRE Links

The guidelines for your LRE environment are based on these factors:

- Maximum distance between the LRE switch and CPE devices—LRE runs on Category 1, 2, and 3 structured and unstructured cable. The maximum distance supported on the LRE link is from 3500 to 5000 feet (1524 meters), depending on the profile. The higher the rate, the shorter the distance. In buildings where LRE traffic runs over bundled telco cabling, the maximum distance is approximately 30 percent lower.
  Each terminated bridge tap in a room can further reduce LRE link distances by 300 feet (91 meters). The quality of the cable, the size of the cable bundles, and cross talk within the bundle also can affect overall reach.
- Site type—If your site has either a private branch exchange (PBX) providing telephone service throughout or has direct connections to the PSTN, you must identify the requirements of your local public telephone service provider.
  If your site is a single building (or is a connected set of buildings), consult a qualified electrician to ensure that the wiring conforms to the appropriate regulations for indoor circuits.
  If your site has separate buildings, you must determine how the buildings are cabled to each other. Where the wiring between the LRE switch and CPE device leaves the building (or the armored conduits certified for inside wiring standards), it must be protected against lightning and shorts to high-voltage power. This protection might be provided by fuses or overvoltage protectors that comply with local regulations for outside wiring protection. Consult an expert in local telecommunications regulations for the details of this protection.
- Age and type of wiring—You can estimate the type of wiring you have based on your site’s age and type.
  - Newer installations less than 15 years old often use Category 3 cable in bundles of 25 pairs. There is no significant difference between 25-pair bundles and larger bundles.
  - Older installations (hotel, school, hospital, commercial—North America) 15 to 30 years old often use 24 American Wire Gauge (AWG) wiring with between 1 and 12 twists per foot (similar to Category 1) in bundles of 25 or more.
  - Older installations (residential—North America) 15 to 30 years old often use 26 AWG wiring with between 1 and 12 twists per foot (possibly type-2) in bundles of 100 or more.
  - Older installations (Europe) 15 to 30 years old often use 0.4 millimeter (similar to 26 AWG) wiring with between 1 and 12 twists per foot in bundles of 100 or more.
  - Older installations (Asia) 15 to 30 years old often use 0.4 millimeter (similar to 26 AWG) wiring with between 1 and 12 twists per foot in bundles of 100 or more.
Older installations over 30 years old often use heavy gauge wire (22 or 20 AWG) with no significant twist. In many cases, the cabling is set into the fabric of the building. The cables might be tightly or loosely bundled. For this estimate, assume that they are tightly bundled in groups of 25 or more.

- Cross talk (noise) and interference—LRE operates with any number of wires in a cable binder carrying the LRE signal. Anywhere from one wire pair to every wire pair in the cable can carry LRE signals at the same time. LRE operates in full cable binders and adjusts power levels on each LRE link to maximize the performance of all connections.

The greatest impact on LRE performance is from the frequency response of the cable at the higher frequencies. LRE signals are more susceptible to interference at higher frequencies. The LRE upstream signal operates at the high end of the frequency spectrum. Cables have higher attenuation at higher frequencies and also interfere with other pairs in the bundle at higher frequencies. This interference or cross talk can significantly impact the signal quality.

**Guidelines for Using LRE Profiles**

When assigning a profile to a switch LRE port, keep these considerations in mind:

- Phone lines typically operate at a frequency of up to 3.4 kHz. On the LRE link, the downstream transmission runs in a low-frequency band from approximately 1 to 3.5 MHz. The upstream transmission runs in a high-frequency band from approximately 4 to 8 MHz. Higher frequencies are more susceptible to interference. Consequently, upstream signals are susceptible to cross-talk and disruption on the link.

To maintain the quality of the LRE connection, use the asymmetric port profiles. These profiles use a low upstream rate but provide a high downstream rate.

**Note**

All POTS telephones not directly connected to the CPE device require microfilters with a 300-ohm termination. Microfilters improve voice call quality when voice and data equipment are using the same telephone line. They also prevent nonfiltered telephone rings and nonfiltered telephone transitions (such as on-hook to off-hook) from interrupting the LRE connection.

- When the link between the LRE switch and the CPE device must co-exist in the same cable bundle as an asymmetric digital subscriber line (ADSL), we recommend that you use either the ANSI profile (LRE-998-15-4) or the ETSI profile (LRE-997-10-4). For details on which profile to use elsewhere, consult the regulations for connecting to the PSTN in your area.

- LRE signaling can co-exist with ADSL signaling in one cable bundle. However, LRE signaling is not compatible with T1 signals in the same cable bundle.

Use the `show controllers lre status link` privileged EXEC command to display the LRE link statistics and profile information on the LRE ports. For information about this command, see the switch command reference.

**CPE Ethernet Link Guidelines**

Follow these guidelines when configuring CPE Ethernet links:

- Guidelines for Configuring Cisco 575 LRE CPEs and 576 LRE 997 CPEs, page 12-11
- Guidelines for Configuring Cisco 585 LRE CPEs, page 12-11
Guidelines for Configuring Cisco 575 LRE CPEs and 576 LRE 997 CPEs

You can configure the CPE Ethernet port to operate at 10 or 100 Mbps and at half- or full-duplex mode, depending on the capability of the remote Ethernet device. Autonegotiation for port speed and duplex mode is supported.

The default speed for the CPE Ethernet port is auto. The default duplex mode is half duplex with back pressure.

When the default speed is set to 10 or 100 Mbps with half duplex, the values set are the same. Table 12-5 shows the speed and duplex settings on the CPE Ethernet port and the switch Ethernet port.

<table>
<thead>
<tr>
<th>Speed</th>
<th>Duplex</th>
<th>Speed</th>
<th>Duplex</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Full</td>
<td>10</td>
<td>Half</td>
</tr>
<tr>
<td>10</td>
<td>Half</td>
<td>100</td>
<td>Half</td>
</tr>
<tr>
<td>100</td>
<td>Full</td>
<td>100</td>
<td>Half</td>
</tr>
<tr>
<td>100</td>
<td>Half</td>
<td>100</td>
<td>Half</td>
</tr>
</tbody>
</table>

The LRE link speed and duplex values are profile independent. All LRE links have a default speed of 100 Mbps with half duplex except for the profile LRE-10 (on the Catalyst 2950ST-8 LRE and 2950ST-24 LRE switches), which is set to 10 Mbps with full duplex.

Guidelines for Configuring Cisco 585 LRE CPEs

You can configure the Cisco 585 LRE CPE Ethernet port speed and duplex mode from the CLI, depending on the capability of the remote Ethernet device. Autonegotiation for CPE port speed and duplex mode is supported. Use the `cpe duplex` and `cpe speed` interface configuration commands, respectively, to configure the duplex and speed settings on a Cisco 585 LRE CPE or the 576 LRE 997 CPE Ethernet port.

The default speed for the CPE Ethernet ports is auto. The default duplex mode is half duplex at 100 Mbps with back pressure.

You can enable or disable the CPE Ethernet ports on a per-port basis.

You can disable CPE toggle on a Cisco 585 LRE CPE.
The loopback interface configuration command is not supported on the LRE ports. External loopback on the LRE ports is also not supported. Connecting a CPE Ethernet port to another Ethernet port on the same CPE device can create a loop. If this happens, the switch stops sending to the CPE device and blocks Ethernet traffic coming from the CPE device.

Assigning a Global Profile to All LRE Ports

Global profiles are set on a switch-wide basis. Port sequences, global sequences, and port profiles have priority over global profiles (see the “Precedence” section on page 12-15). If you assign a global profile to the switch, it cannot override any previously or subsequently set sequence port profile. For more information on sequence and profile precedence, see the “Guidelines for Using LRE Profiles” section on page 12-10.

Changes to the global profile settings are immediately put in effect, and the global mode automatically becomes the active mode.

Beginning in privileged EXEC mode, follow these steps to assign a global profile to the LRE ports:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: lre profile profile-name</td>
<td>Enter the global profile name. Select from the list in Table 12-1 on page 12-3 or Table 12-2 on page 12-3.</td>
</tr>
<tr>
<td>Step 3: end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4: show controllers lre profile details</td>
<td>Verify the change.</td>
</tr>
<tr>
<td>Step 5: copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default global profile, use the no lre profile profile-name global configuration command.

To display the LRE link statistics and profile information on the LRE ports, use the show controllers lre privileged EXEC commands.

Assigning a Profile to a Specific LRE Port

You can set profiles on a per-port basis. You can assign the same profile or different profiles to the LRE ports on the switch. The default active profile on all LRE ports is LRE-10 on the Catalyst 2950ST-8 LRE and 2950ST-24 LRE switches and LRE-6 on the Catalyst 2950ST-24 LRE 997 switch.

The switch resets the ports with the updated profile settings when they are changed.

Beginning in privileged EXEC mode, follow these steps to assign a profile to a specific LRE port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: interface interface-id</td>
<td>Specify the LRE port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3: profile profile-name</td>
<td>Enter the port profile name (select from the list in Table 12-1 on page 12-3 or Table 12-2 on page 12-3).</td>
</tr>
</tbody>
</table>
Chapter 12 Configuring LRE

Configuring LRE Ports

Chapter 12 Configuring LRE

To delete the profile from a sequence, use the `no profile profile-name` interface configuration command.

To display the LRE link statistics and profile information on the LRE ports, use the `show controllers lre privileged EXEC command`.

Assigning a Global Sequence to All LRE Ports

Global sequences are set on a switch-wide basis. If you assign a global sequence to the switch, it overrides any previously or subsequently set profiles. For more information on sequence and profile precedence, see the “Guidelines for Using LRE Profiles” section on page 12-10.

Changes to the global sequence settings are immediately put in effect, and the global mode automatically becomes the active mode.

Beginning in privileged EXEC mode, follow these steps to assign a global sequence to the LRE ports:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>5</td>
<td><code>show controllers lre profile details</code></td>
<td>Verify the change.</td>
</tr>
<tr>
<td>6</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
<td></td>
</tr>
</tbody>
</table>

To delete the assigned sequence, use the `no lre rate selection sequence sequence-name` global configuration command.

To display the LRE link statistics and sequence information on the LRE ports, use the `show controllers lre privileged EXEC command`.

Assigning a Sequence to a Specific LRE Port

You can set sequences on a per-port basis. You can assign the same sequence or different sequences to the LRE ports on the switch. If you assign a sequence on a per-port basis, it overrides any previously or subsequently set profiles or global sequence.

The switch resets the ports with the updated sequence settings when they are changed.

Beginning in privileged EXEC mode, follow these steps to assign a sequence to a specific LRE port:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td><code>lre rate selection sequence sequence-name</code></td>
<td>Enter the global sequence name. Select from the list in Table 12-3 on page 12-5 and Table 12-4 on page 12-5.</td>
</tr>
<tr>
<td>3</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td><code>show controllers lre status sequence</code></td>
<td>Verify the change.</td>
</tr>
<tr>
<td>5</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
<td></td>
</tr>
</tbody>
</table>

To delete the assigned sequence, use the `no lre rate selection sequence sequence-name` global configuration command.

To display the LRE link statistics and sequence information on the LRE ports, use the `show controllers lre status sequence details` privileged EXEC command.

Assigning a Sequence to a Specific LRE Port

You can set sequences on a per-port basis. You can assign the same sequence or different sequences to the LRE ports on the switch. If you assign a sequence on a per-port basis, it overrides any previously or subsequently set profiles or global sequence.

The switch resets the ports with the updated sequence settings when they are changed.

Beginning in privileged EXEC mode, follow these steps to assign a sequence to a specific LRE port:
Configuring LRE Ports

To remove a sequence from a port, use the `no sequence sequence-name` interface configuration command.

To display the LRE link statistics and sequence information on the LRE ports, use the `show controllers lre status sequence details` privileged EXEC command.

### Using Rate Selection to Automatically Assign Profiles

An LRE network requires a profile to be configured for each LRE port that is connected to a CPE device. The default is LRE-10 on the Catalyst 2950ST-8 LRE and 2950ST-24 LRE switches and LRE-6 on the Catalyst 2950ST-24 LRE 997 switch. You can use the rate selection feature to automatically choose a profile from a set of profiles that the switch port uses to establish an LRE link (a link between an LRE switch port and an attached CPE device).

Rate selection is enabled by default, but you must choose a sequence for rate selection to start (in other words, there is no default sequence defined). When rate selection is running, the switch chooses the profile for the LRE interface from a sequence, or predefined series of profiles, that are configured for that interface. The rate-selection algorithm begins with the first profile in the sequence and successively tries the next profiles (in descending order) until a link is established with the CPE device.

When rate selection is enabled, the LRE switch executes rate selection in these scenarios:

- When the switch is started up
- When you enable the rate selection feature
- When you connect a new CPE device to the switch
- When a link is lost for 25 seconds before being restored
- When a configured sequence is modified

In any of these cases, rate selection obtains the optimal profile for your line conditions.

### Command Table

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>sequence sequence-name</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show controllers lre status sequence details</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove a sequence from a port, use the `no sequence sequence-name` interface configuration command.

To display the LRE link statistics and sequence information on the LRE ports, use the `show controllers lre status sequence details` privileged EXEC command.

### Note

When an LRE link is lost for fewer than 25 seconds, the switch does not execute rate selection to re-establish the link. The link is re-established at the profile used before link loss.

The switch chooses the appropriate profile for an LRE interface when it executes rate selection. If line conditions of the LRE interface change, rate selection must be executed again.
Precedence

The rate selection feature can be applied at both the port level and at the switch level. Profiles and sequences have a system-defined priority level that work with rate selection to determine the rate for a port or the entire switch. Port sequences have the highest priority; that is, they take precedence over any other profile or sequence. The priority levels, from highest to lowest, are as shown:

1. Port sequence: rate selection is enabled on the given port only with the given sequence.
2. Global sequence: rate selection is enabled for the entire switch with the given sequence.
3. Port profile: rate selection is enabled for the given port only with the given profile.
4. Global profile: rate selection is enabled for the entire switch with the given profile.

See Table 12-1 on page 12-3 and Table 12-2 on page 12-3 for the list of profiles and Table 12-3 on page 12-5 and Table 12-4 on page 12-5 for the list of system-defined sequences. You can also use CLI commands to define your own sequences.

Note

If rate selection is disabled for a port, profiles are used.

Profile Locking

You can also use rate selection as an installation tool to lock in a particular profile. In this case, you execute rate selection only once at installation; afterwards, rate selection is never executed, even if one of the four listed events occur. You use the rate selection profile lock interface configuration command to lock the profile chosen by rate selection. You can also enter the clear lre rate section [lock] [interface-id] privileged EXEC command to rerun rate selection on the interfaces that have locked the profiles, as needed.

An advantage to profile locking is that the convergence time during bootup is faster if a profile is locked on an LRE port rather than having to go through a profile sequence.

Beginning in privileged EXEC mode, follow these steps to lock a profile in an LRE port that has rate selection enabled:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the LRE port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 rate selection profile lock</td>
<td>Lock the profile.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show controllers lre profile details</td>
<td>Verify the change.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To unlock a port, use the no rate selection profile lock interface configuration command.
Link Qualification and SNR Margins

When rate selection is running, the SNR is used as an indicator of link quality. The switch does not provide any internal mechanism to ensure link quality. There can be different requirements for link quality, depending on the required bit-error rate and the noise level of the environment. A noisier environment would require a higher SNR to be able to provide a stable link. A lower bit-error rate would require a higher SNR. Typically a 6-dB margin provides an error rate of $10^{-21}$ bits.

To provide link stability, you should add a margin to the required SNR. You can configure your margins to an amount that is appropriate for the noise level of your environment. Increasing the margin requirement can cause the system to choose a lower profile, which would in turn translate to a lower rate but with a higher reach.

The switch does not guarantee any margins after a link is activated; margins are only guaranteed only when the link is established. When a link is activated, if the SNR requirements do not match the configured margin level, the link is not established.

Downstream means the remote end of the link, and upstream the local end. The link has to satisfy both the local and remote margin requirements. If either one is not met, the link is advertised as down. This command has no significance if rate selection is disabled on the interface.

Table 12-6 and Table 12-8 list the SNR requirements for downstream rates for different profiles. Table 12-7 and Table 12-9 list the SNR requirements for upstream rates for different profiles.

The margin range for link qualification is from 1 to 10 dB. The recommended value in a low-noise environment is 2 dB. The recommended value for medium noise environment is 4 dB. The recommended value in a high noise environment is 6 dB.

If a profile has a theoretical minimum of 25 dB and you configure a margin of 3 dB, when the link is established, the SNR should at the least be 28 dB to indicate a successful link. If a link is established and if the SNR value at link time is 27 dB, the link is advertised as down, and the next profile in the sequence is attempted. If you configure a margin of 0 (the default value), the software does not check for the SNR value when the link is established.

Beginning in privileged EXEC mode, follow these steps to assign a margin to a specific LRE port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter the number of the LRE port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 margin {downstream value</td>
<td>upstream value}</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show controllers lre profile details</td>
<td>Verify the change.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default values, use the **no margin {downstream | upstream}** interface configuration command.

**Note**  The **margin** command is effective with any profile, but only with rate selection and only when a link is being activated.
Configuring LRE Link Persistence

If the LRE link shuts down and is automatically re-enabled quickly, the switch configuration might change. For example, the dynamic MAC addresses are removed from the MAC address table. You can use the link persistence feature to configure a delay duration on the Catalyst 2950 LRE switch of up to 20 seconds before link failure is reported.

Beginning in privileged EXEC mode, follow these steps to set the delay duration on a specific LRE port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the LRE port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 persistence delay</td>
<td>Enter the length of time (in seconds) for the delay duration. The default is 3 seconds. The range is 1 to 20 seconds.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show controllers lre status persistence</td>
<td>Verify the change.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default value, use the no persistence interface configuration command.

Configuring LRE Link Monitor

When link monitor is enabled, an LRE switch feature tracks undesirable or interesting conditions on a link or takes system-defined actions after certain thresholds are reached.

Beginning in privileged EXEC mode, follow these steps to enable link monitor:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the LRE port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 link monitor</td>
<td>Enable LRE link monitoring on an LRE port.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show running-config</td>
<td>Verify the change.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable the link monitor feature, use the no link monitor interface configuration command.

Configuring LRE Interleave

The interleave feature provides maximum protection against small interruptions on the LRE link but delays data transmission. You can configure the interleave delay on LRE interfaces.
A lower value of the interleave block size means less tolerance to noise and causes a lower latency of frame transmission. For example, lower values of the interleave block size can be used for voice applications. A higher value of the interleave block size means higher tolerance to noise and causes higher latency in the frame transmission. For example, higher values of the interleave block size can be used for data applications.

If a lower latency of frame transmission is required, you can use a lower interleave value, but the LRE switch will have less tolerance to noise.

Follow these guidelines for configuring the interleave delay:

- Interleave delay is applicable only when the non-LL profiles are used. Existing LL profiles are supported.
- Different ports with the same profile can have different interleave settings.

Beginning in privileged EXEC mode, follow these steps to set the interleave block size on a specific LRE port:

To return the port to its default setting, use the `no interleave downstream value upstream value` interface configuration command.

### Configuring Upstream Power Back-Off

You can configure this feature only on a Catalyst 2950ST-24 LRE 997 switch.

The upstream power back-off mechanism allows for normalization of the upstream receive power levels by requiring the CPE devices on shorter lines to send at a lower power level than the CPEs on longer lines. You can change the upstream power back-off values by either selecting a standard noise model or by setting an offset value for the default reference power spectral density (PSD).

Follow these guidelines for configuring upstream power back-off:

- The reference PSD number is based on an upstream carrier frequency of 4.8 MHz.
- You can use the offset values to adjust the CPE transmit reference PSD relative to the default reference of –140 dBm/Hz. A zero value for the offset corresponds to a reference PSD of –140 dBm/Hz. The smallest offset is 30 dBm/Hz, and the corresponding value is 300.

When you enter the `lre upbo` global configuration command, all LRE links are reset to the UP state. Before configuring the reference TX power level, follow these guidelines:

- Verify how this command affects the network in a lab environment.

### Command and Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
<td>Specify the LRE port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>interleave downstream value upstream value</td>
<td>Enter the downstream and upstream values. Supported values for interleave block sizes are 0, 1, 2, 8, or 16.</td>
</tr>
<tr>
<td>4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>5</td>
<td>show controllers lre status interleave</td>
<td>Verify the change.</td>
</tr>
<tr>
<td>6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
- Make sure that all the CPEs in the production network are running the same LRE binary version. Use the `show controllers lre cpe version` privileged EXEC command to display the binary version on all CPE device interfaces.

Caution Changing the noise model while the switch is functioning in a network can disrupt the network operation.

Beginning in privileged EXEC mode, follow these steps to configure upstream power back-off on a Catalyst 2950ST-24 LRE 997 switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>lre upbo <code>{noise-model \ offset value}</code> Enter the noise level or the offset value. Supported noise-model values are <code>etsi-a</code>, <code>etsi-b</code>, <code>etsi-c</code>, <code>etsi-d</code> and <code>etsi-f</code>. The offset value is calculated with reference to (-140). For example, if you require a reference PSD of (-95 \text{ dbm/Hz}), you need to enter the offset of 45 ((–95 – [–140] = 45)). The supported value range is 300 to 800. <strong>Note</strong> The LRE CPE power spectral density (PSD) offset value is in (10 \ast \text{dB}) (for example, 450 means 45 dB).</td>
</tr>
<tr>
<td>Step 3</td>
<td>end Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>show controllers lre status psd Verify the change.</td>
</tr>
<tr>
<td>Step 5</td>
<td>show controllers lre cpe version Displays the LRE binary version running on the CPE.</td>
</tr>
<tr>
<td>Command</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no lre upbo `{noise-model \ offset value}` global configuration command.

**Configuring CPE Toggle**

The CPE toggle feature is enabled by default. It cannot be disabled on a link from a Cisco 575 LRE or Cisco 576 LRE 997 CPE to a remote Ethernet device (such as PC).

You can disable CPE toggle on a Cisco 585 LRE CPE link. Then the CPE Ethernet link does not transition to the up state when the LRE link comes up.

Beginning in privileged EXEC mode, follow these steps to disable CPE toggle on a Cisco 585 LRE CPE link:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface <code>interface-id</code> Specify the LRE port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>no cpe toggle <code>[port port-id]</code> Disable CPE toggle on a CPE Ethernet link. (Optional) Specify the CPE port on which CPE toggle is disabled.</td>
</tr>
</tbody>
</table>
To re-enable CPE toggle on the Cisco 585 LRE CPE link, use the `cpe toggle [port port-id]` interface configuration command.

### Configuring Syslog Export

If the syslog export feature is enabled, the switch sends the debugging messages to the LRE message logging process and to the system message logging process.

Before enabling this feature, follow these guidelines:

- Make sure that LRE logging is enabled.
- Make sure that the console severity in the system message logging configuration is set to debugging.

For more information, see Chapter 26, “Configuring System Message Logging.”

Beginning in privileged EXEC mode, follow these steps to enable the switch to send debugging messages to the LRE message logging process and to the system message logging process:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 lre syslog</td>
<td>Enable the switch to send debugging messages from the LRE logging process to the system message logging process.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show running-config</td>
<td>Verify the change.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable the syslog export feature, use the `no lre syslog` global configuration command. When you enter this command, the switch sends debugging messages only to the LRE message logging process.

Beginning in privileged EXEC mode, follow these steps to specify the mode in which to log LRE events:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the LRE port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 logging lre {event</td>
<td>extended</td>
</tr>
<tr>
<td></td>
<td>• event—Log events only.</td>
</tr>
<tr>
<td></td>
<td>• extended—Log events and all possible parameters.</td>
</tr>
<tr>
<td></td>
<td>• normal—Log events and some typical parameters.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
To turn off the logging of events, use the `no logging lre {event | extended | normal}` interface configuration command.

### Upgrading LRE Switch Firmware

The Catalyst 2950 LRE switch can store and properly apply LRE binaries in case there are updates required to the firmware on the switch local LRE controllers or connected CPE devices.

Other desirable upgrade-related features include:

- Allowing you to use an earlier version of the LRE software if required.
- Simplifying the upgrade process as much as possible, especially in cases where you want to upgrade multiple CPE devices by using a single command.

#### Note
Whether upgrading a single CPE device or all CPE devices connected to an LRE switch, the expected duration of an LRE upgrade is 3 to 6 minutes. (CPE devices connected to marginal links might take longer than this to upgrade.)

You perform an upgrade by using the `hw-module slot module-slot-number upgrade lre [force] [local ctrlr-unit-number | remote interface-id]` privileged EXEC command.

Automatic upgrading is not supported. You can upgrade in one of these ways:

- Upgrade a single remote CPE device.
- Upgrade a single local LRE controller (local LRE chipset).
- Upgrade all CPE devices and local chipsets that require an upgrade (a system-wide upgrade, which is the default).

### Configuring for an LRE Upgrade

In the absence of any LRE upgrade configurations, the LRE upgrade attempts to upgrade all local LRE controllers and CPE devices to the most recent compatible versions of the LRE binaries required for each LRE target device. LRE upgrade configurations should rarely be required. The primary purpose of LRE upgrade configuration commands is to provide for downgrades of LRE binaries.

If you wish to override the automatic switch selection of LRE binaries, these methods are available:

- Global LRE upgrade configuration commands
- LRE controller configuration commands

You can specify the LRE binary or binaries for a specified `target type`. A target type is the family (and optionally the model or model revision) of a device containing one or more upgradable hardware elements. A target can be a local LRE controller on the switch or a remote CPE device.

You can perform global LRE upgrade configurations by entering the `upgrade binary` and the `upgrade preserve` controller configuration commands.
Performing an LRE Upgrade

You can upgrade either on a system-wide basis (in other words, upgrading the software on all connected CPE devices and local LRE chipsets) or on individual CPE device or LRE controllers. By default, a system-wide upgrade applies the most recent versions of LRE binaries that are most compatible with each upgradable hardware module. The system-wide upgrade method is the one that you use in almost all situations.

When executing upgrades, you can elect to upgrade a single CPE device or local controller by using the `hw-module slot module-slot-number upgrade lre [force] [local ctrlr-unit-number | remote interface-id]` privileged EXEC command. If no local or remote option is given, a system-wide upgrade is performed.

Global Configuration of LRE Upgrades

Beginning in privileged EXEC mode, follow these steps to perform a system-wide upgrade to configure the LRE binary to apply to a target device and upgradable hardware element combination:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: lre binary default target_device LRE_binary</td>
<td>Enter the device to which the LRE binary should be applied and the LRE binary to be applied.</td>
</tr>
<tr>
<td>Step 3: end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4: show lre upgrade version</td>
<td>Verify the change.</td>
</tr>
</tbody>
</table>

Controller Configuration of LRE Upgrades

Beginning in privileged EXEC mode, follow these steps to explicitly direct the LRE binaries to be applied to either the local controller or a specific very-high-data-rate digital subscriber line (VDSL) link:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: controller lre chipset_number</td>
<td>Enter the particular LRE local chipset on the switch to be applied.</td>
</tr>
</tbody>
</table>
You can use the `upgrade` controller configuration command to override the system default selection of an LRE binary that will be applied on either end of a particular LRE link. Controller configurations take precedence over global upgrade configurations.

The `preserve` keyword causes the LRE upgrade mechanism to *not* upgrade the local controller on which `preserve` is configured or any of the CPE devices connected to that controller. If you want to preserve (in other words, not upgrade) some of the CPE devices connected to a particular controller but allow upgrades to others, you can enter controller upgrade configuration commands for the links you want to upgrade.

The `no upgrade` controller configuration command removes the command for applying a particular LRE binary. To resume default upgrade behavior for a given controller, do not configure the custom upgrade commands on that controller.

### LRE Upgrade Details

This example shows how to upgrade your LRE switch:

```
Switch> enable
Switch# hw-module slot 0 upgrade lre
You are about to start an LRE upgrade on all LRE interfaces.
Users on LRE links being upgraded will experience a temporary disruption of Ethernet connectivity.
Start LRE upgrade ? [yes]:
```

If you answer `yes` or press the Enter key, the upgrade starts. If you answer `no`, you get the EXEC prompt.

During an upgrade, this process occurs:

- When the upgrade starts, the link is probably in the `link-up` state, the state of the link that is useful to you.
- When the upgrade starts, the remote CPE device resets. Ethernet connectivity is temporarily lost.
- The CPE device comes up, with the link slower (about 1 Mbps upstream and 4 Mbps downstream) but more reliable. The increased reliability is required for a successful LRE binary transfer. The LRE link stays at a slower speed for the duration of the upgrade. Ethernet connectivity is available.
- When the upgrade is complete, the CPE device is again reset so that the upgraded LRE binaries are loaded and executed on the target CPE devices and local LRE chipsets. Ethernet connectivity is again disrupted until the CPE finishes resetting.
- The link comes up when the CPE device comes back up, and then progresses to where it resumes full operation at its intended data rate.

After an upgrade is complete, the switch configuration shows this information about the LRE interfaces, which does not affect the switch functionality:

```
<output truncated>
!
controller LongReachEthernet 0
```
Chapter 12      Configuring LRE

Upgrading LRE Switch Firmware

LRE Upgrade Example

This example shows how an LRE upgrade occurs:

Switch# hw-module slot 0 upgrade lre force remote longreachethernet 0/1

You are about to start an LRE upgrade on CPE Lo0/1. Users on LRE links being upgraded will experience a temporary disruption of Ethernet connectivity.

Start LRE upgrade? [yes]:

Starting remote upgrade on CPE Lo0/1

Switch#

00:21:51: %LINEPROTO-5-UPDOWN: Line protocol on Interface LongReachEthernet0/1, changed state to down

The CPE device is reset and the link is down. Ethernet connectivity is unavailable at this point.

00:22:37: %LINK-3-UPDOWN: Interface LongReachEthernet0/1, changed state to up
00:22:39: %LINEPROTO-5-UPDOWN: Line protocol on Interface LongReachEthernet0/1, changed state to up

The CPE device finishes resetting. Ethernet connectivity is available but at low speeds. Upgrade data transfer begins.

00:23:55: %LINEPROTO-5-UPDOWN: Line protocol on Interface LongReachEthernet0/1, changed state to down

Upgrade data transfer is complete. Reset the CPE device.

00:23:56: %LINK-3-UPDOWN: Interface LongReachEthernet0/1, changed state to up

The CPE device has finished resetting. The desired profile is applied.

00:23:58: %LRE_LINK-3-UPDOWN: Interface Lo0/1, changed state to UP
00:23:59: %LINK-3-UPDOWN: Interface LongReachEthernet0/1, changed state to up
00:24:02: %LINEPROTO-5-UPDOWN: Line protocol on Interface LongReachEthernet0/1, changed state to up

Operation resumes in the profile link up state.

Switch#
Displaying LRE Status

To display the LRE information, use one or more of the privileged EXEC commands in Table 12-10.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show controllers ethernet-controller</td>
<td>Display the Ethernet link send and receive statistics on a Fast Ethernet port.</td>
</tr>
<tr>
<td>show controllers lre profile details</td>
<td>Display information about the LRE profiles.</td>
</tr>
<tr>
<td>show controllers lre status</td>
<td>Display the LRE link statistics and profile information on an LRE switch port.</td>
</tr>
</tbody>
</table>

For detailed information about the fields in the command outputs, see the command reference for this release.
CHAPTER 13

Configuring STP

This chapter describes how to configure the Spanning Tree Protocol (STP) on port-based VLANs on your Catalyst 2950 or Catalyst 2955 switch. The switch can use either the per-VLAN spanning-tree plus (PVST+) protocol based on the IEEE 802.1D standard and Cisco proprietary extensions, or the rapid per-VLAN spanning-tree plus (rapid-PVST+) protocol based on the IEEE 802.1w standard.

For information about the Multiple Spanning Tree Protocol (MSTP) and how to map multiple VLANs to the same spanning-tree instance, see Chapter 14, “Configuring MSTP.”

For information about other spanning-tree features such as Port Fast, UplinkFast, root guard, and so forth, see Chapter 15, “Configuring Optional Spanning-Tree Features.”

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Understanding Spanning-Tree Features, page 13-1
- Configuring Spanning-Tree Features, page 13-10
- Displaying the Spanning-Tree Status, page 13-23

Understanding Spanning-Tree Features

These sections describe how basic spanning-tree features work:

- STP Overview, page 13-2
- Spanning-Tree Topology and BPDUs, page 13-2
- Bridge ID, Switch Priority, and Extended System ID, page 13-3
- Spanning-Tree Interface States, page 13-4
- How a Switch or Port Becomes the Root Switch or Root Port, page 13-7
- Spanning Tree and Redundant Connectivity, page 13-7
- Spanning-Tree Address Management, page 13-8
- Accelerated Aging to Retain Connectivity, page 13-8
- Supported Spanning-Tree Instances, page 13-9
- Supported Spanning-Tree Instances, page 13-9
STP Overview

STP is a Layer 2 link management protocol that provides path redundancy while preventing loops in the network. For a Layer 2 Ethernet network to function properly, only one active path can exist between any two stations. Multiple active paths among end stations cause loops in the network. If a loop exists in the network, end stations might receive duplicate messages. Switches might also learn end-station MAC addresses on multiple Layer 2 interfaces. These conditions result in an unstable network. Spanning-tree operation is transparent to end stations, which cannot detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.

The STP uses a spanning-tree algorithm to select one switch of a redundantly connected network as the root of the spanning tree. The algorithm calculates the best loop-free path through a switched Layer 2 network by assigning a role to each port based on the role of the port in the active topology:

- **Root**—A forwarding port elected for the spanning-tree topology
- **Designated**—A forwarding port elected for every switched LAN segment
- **Alternate**—A blocked port providing an alternate path to the root bridge in the spanning tree
- **Backup**—A blocked port in a loopback configuration

The switch that has *all* of its ports as the designated role or as the backup role is the root switch. The switch that has at least *one* of its ports in the designated role is called the designated switch.

Spanning tree forces redundant data paths into a standby (blocked) state. If a network segment in the spanning tree fails and a redundant path exists, the spanning-tree algorithm recalculates the spanning-tree topology and activates the standby path. Switches send and receive spanning-tree frames, called bridge protocol data units (BPDUs), at regular intervals. The switches do not forward these frames but use them to construct a loop-free path. BPDUs contain information about the sending switch and its ports, including switch and MAC addresses, switch priority, port priority, and path cost. Spanning tree uses this information to elect the root switch and root port for the switched network and the root port and designated port for each switched segment.

When two interfaces on a switch are part of a loop, the spanning-tree port priority and path cost settings determine which interface is put in the forwarding state and which is put in the blocking state. The spanning-tree port priority value represents the location of an interface in the network topology and how well it is located to pass traffic. The path cost value represents the media speed.

Spanning-Tree Topology and BPDUs

The stable, active spanning-tree topology of a switched network is determined by these elements:

- The unique bridge ID (switch priority and MAC address) associated with each VLAN on each switch
- The spanning-tree path cost to the root switch
- The port identifier (port priority and MAC address) associated with each Layer 2 interface
When the switches in a network are powered up, each functions as the root switch. Each switch sends a configuration BPDU through all of its ports. The BPDU's communicate and compute the spanning-tree topology. Each configuration BPDU contains this information:

- The unique bridge ID of the switch that the sending switch identifies as the root switch
- The spanning-tree path cost to the root
- The bridge ID of the sending switch
- Message age
- The identifier of the sending interface
- Values for the hello, forward-delay, and max-age protocol timers

When a switch receives a configuration BPDU that contains superior information (lower bridge ID, lower path cost, and so forth), it stores the information for that port. If this BPDU is received on the root port of the switch, the switch also forwards it with an updated message to all attached LANs for which it is the designated switch.

If a switch receives a configuration BPDU that contains inferior information to that currently stored for that port, it discards the BPDU. If the switch is a designated switch for the LAN from which the inferior BPDU was received, it sends that LAN a BPDU containing the up-to-date information stored for that port. In this way, inferior information is discarded, and superior information is propagated on the network.

A BPDU exchange results in these actions:

- One switch in the network is elected as the root switch (the logical center of the spanning-tree topology in a switched network).
  
  For each VLAN, the switch with the highest switch priority (the lowest numerical priority value) is elected as the root switch. If all switches are configured with the default priority (32768), the switch with the lowest MAC address in the VLAN becomes the root switch. The switch priority value occupies the most significant bits of the bridge ID, as shown in Table 13-1 on page 13-4.

- A root port is selected for each switch (except the root switch). This port provides the best path (lowest cost) when the switch forwards packets to the root switch.

- The shortest distance to the root switch is calculated for each switch based on the path cost.

- A designated switch for each LAN segment is selected. The designated switch incurs the lowest path cost when forwarding packets from that LAN to the root switch. The port through which the designated switch is attached to the LAN is called the designated port.

- Interfaces included in the spanning-tree instance are selected. Root ports and designated ports are put in the forwarding state.

- All paths that are not needed to reach the root switch from anywhere in the switched network are placed in the spanning-tree blocking mode.

**Bridge ID, Switch Priority, and Extended System ID**

The IEEE 802.1D standard requires that each switch has an unique bridge identifier (bridge ID), which determines the selection of the root switch. Because each VLAN is considered as a different logical bridge with PVST+ and rapid PVST+, the same switch must have as many different bridge IDs as VLANs configured on it. Each VLAN on the switch has a unique 8-byte bridge ID; the two most-significant bytes are used for the switch priority, and the remaining six bytes are derived from the switch MAC address.
In Cisco IOS Release 12.1(9)EA1 and later, Catalyst 2950 and Catalyst 2955 switches support the IEEE 802.1t spanning-tree extensions. Some of the bits previously used for the switch priority are now used as the VLAN identifier. The result is that fewer MAC addresses are reserved for the switch, and a larger range of VLAN IDs can be supported, all while maintaining the uniqueness of the bridge ID. As shown in Table 13-1, the two bytes previously used for the switch priority are reallocated into a 4-bit priority value and a 12-bit extended system ID value equal to the VLAN ID. In earlier releases, the switch priority is a 16-bit value.

<table>
<thead>
<tr>
<th>Switch Priority Value</th>
<th>Extended System ID (Set Equal to the VLAN ID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 16</td>
<td>Bit 15</td>
</tr>
<tr>
<td>32768</td>
<td>16384</td>
</tr>
</tbody>
</table>

Spanning tree uses the extended system ID, the switch priority, and the allocated spanning-tree MAC address to make the bridge ID unique for each VLAN. With earlier releases, spanning tree used one MAC address per VLAN to make the bridge ID unique for each VLAN.

Support for the extended system ID affects how you manually configure the root switch, the secondary root switch, and the switch priority of a VLAN. For example, when you change the switch priority value, you change the probability that the switch will be elected as the root switch. Configuring a higher value decreases the probability; a lower value increases the probability. For more information, see the “Configuring the Root Switch” section on page 13-14, the “Configuring a Secondary Root Switch” section on page 13-16, and the “Configuring the Switch Priority of a VLAN” section on page 13-19.

Spanning-Tree Interface States

Propagation delays can occur when protocol information passes through a switched LAN. As a result, topology changes can take place at different times and at different places in a switched network. When an interface transitions directly from nonparticipation in the spanning-tree topology to the forwarding state, it can create temporary data loops. Interfaces must wait for new topology information to propagate through the switched LAN before starting to forward frames. They must allow the frame lifetime to expire for forwarded frames that have used the old topology.

Each Layer 2 interface on a switch using spanning tree exists in one of these states:

- **Blocking**—The interface does not participate in frame forwarding.
- **Listening**—The first transitional state after the blocking state when the spanning tree determines that the interface should participate in frame forwarding.
- **Learning**—The interface prepares to participate in frame forwarding.
- **Forwarding**—The interface forwards frames.
- **Disabled**—The interface is not participating in spanning tree because of a shutdown port, no link on the port, or no spanning-tree instance running on the port.

An interface moves through these states:

- From initialization to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
From forwarding to disabled

Figure 13-1 illustrates how an interface moves through the states.

![Spanning-Tree Interface States Diagram]

When you power up the switch, spanning tree is enabled by default, and every interface in the switch, VLAN, or network goes through the blocking state and the transitory states of listening and learning. Spanning tree stabilizes each interface at the forwarding or blocking state.

When the spanning-tree algorithm places a Layer 2 interface in the forwarding state, this process occurs:

1. The interface is in the listening state while spanning tree waits for protocol information to transition the interface to the blocking state.
2. While the spanning tree waits for the forward-delay timer to expire, it moves the interface to the learning state and resets the forward-delay timer.
3. In the learning state, the interface continues to block frame forwarding as the switch learns end-station location information for the forwarding database.
4. When the forward-delay timer expires, spanning tree moves the interface to the forwarding state, where both learning and frame forwarding are enabled.

**Blocking State**

A Layer 2 interface in the blocking state does not participate in frame forwarding. After initialization, a BPDU is sent to each interface in the switch. A switch initially functions as the root until it exchanges BPDUs with other switches. This exchange establishes which switch in the network is the root or root switch. If there is only one switch in the network, no exchange occurs, the forward-delay timer expires, and the interfaces move to the listening state. An interface always enters the blocking state after switch initialization.

An interface in the blocking state performs as follows:

- Discards frames received on the port
- Discards frames switched from another interface for forwarding
- Does not learn addresses
• Receives BPDUs

Listening State

The listening state is the first state a Layer 2 interface enters after the blocking state. The interface enters this state when the spanning tree determines that the interface should participate in frame forwarding.

An interface in the listening state performs as follows:

• Discards frames received on the port
• Discards frames switched from another interface for forwarding
• Does not learn addresses
• Receives BPDUs

Learning State

A Layer 2 interface in the learning state prepares to participate in frame forwarding. The interface enters the learning state from the listening state.

An interface in the learning state performs as follows:

• Discards frames received on the port
• Discards frames switched from another interface for forwarding
• Learns addresses
• Receives BPDUs

Forwarding State

A Layer 2 interface in the forwarding state forwards frames. The interface enters the forwarding state from the learning state.

An interface in the forwarding state performs as follows:

• Receives and forwards frames received on the port
• Forwards frames switched from another port
• Learns addresses
• Receives BPDUs

Disabled State

A Layer 2 interface in the disabled state does not participate in frame forwarding or in the spanning tree. An interface in the disabled state is nonoperational.

A disabled interface performs as follows:

• Discards frames received on the port
• Discards frames switched from another interface for forwarding
• Does not learn addresses
• Does not receive BPDUs
How a Switch or Port Becomes the Root Switch or Root Port

If all switches in a network are enabled with default spanning-tree settings, the switch with the lowest MAC address becomes the root switch. In Figure 13-2, Switch A is elected as the root switch because the switch priority of all the switches is set to the default (32768) and Switch A has the lowest MAC address. However, because of traffic patterns, number of forwarding interfaces, or link types, Switch A might not be the ideal root switch. By increasing the priority (lowering the numerical value) of the ideal switch so that it becomes the root switch, you force a spanning-tree recalculation to form a new topology with the ideal switch as the root.

![Spanning-Tree Topology](image)

When the spanning-tree topology is calculated based on default parameters, the path between source and destination end stations in a switched network might not be ideal. For instance, connecting higher-speed links to an interface that has a higher number than the root port can cause a root-port change. The goal is to make the fastest link the root port.

For example, assume that one port on Switch B is a Gigabit Ethernet link and that another port on Switch B (a 10/100 Mbps link) is the root port. Network traffic might be more efficient over the Gigabit Ethernet link. By changing the spanning-tree port priority on the Gigabit Ethernet interface to a higher priority (lower numerical value) than the root port, the Gigabit Ethernet interface becomes the new root port.

Spanning Tree and Redundant Connectivity

You can create a redundant backbone with spanning tree by connecting two switch interfaces to another device or to two different devices. Spanning tree automatically disables one interface but enables it if the other one fails, as shown in Figure 13-3. If one link is high-speed and the other is low-speed, the low-speed link is always disabled. If the speeds are the same, the port priority and port ID are added together, and spanning tree disables the link with the lowest value.
You can also create redundant links between switches by using EtherChannel groups. For more information, see Chapter 30, “Configuring EtherChannels.”

### Spanning-Tree Address Management

IEEE 802.1D specifies 17 multicast addresses, ranging from 0x00180C2000000 to 0x0180C2000010, to be used by different bridge protocols. These addresses are static addresses that cannot be removed.

Regardless of the spanning-tree state, the switch receives but does not forward packets destined for addresses between 0x0180C2000000 and 0x0180C2000010.

If spanning tree is enabled, the switch CPU receives packets destined for 0x0180C2000000 and 0x0180C2000010. If spanning-tree is disabled, the switch forwards those packets as unknown multicast addresses.

### Accelerated Aging to Retain Connectivity

The default for aging dynamic addresses is 5 minutes, the default setting of the `mac-address-table aging-time` global configuration command. However, a spanning-tree reconfiguration can cause many station locations to change. Because these stations could be unreachable for 5 minutes or more during a reconfiguration, the address-aging time is accelerated so that station addresses can be dropped from the address table and then relearned. The accelerated aging is the same as the forward-delay parameter value (`spanning-tree vlan vlan-id forward-time seconds` global configuration command) when the spanning tree reconfigures.

Because each VLAN is a separate spanning-tree instance, the switch accelerates aging on a per-VLAN basis. A spanning-tree reconfiguration on one VLAN can cause the dynamic addresses learned on that VLAN to be subject to accelerated aging. Dynamic addresses on other VLANs can be unaffected and remain subject to the aging interval entered for the switch.
Spanning-Tree Modes and Protocols

The switch supports these spanning-tree modes and protocols:

- **PVST+**—This spanning-tree mode is based on the IEEE 802.1D standard and Cisco proprietary extensions. It is the default spanning-tree mode used on all Ethernet, Fast Ethernet, and Gigabit Ethernet port-based VLANs. The PVST+ runs on each VLAN on the switch up to the maximum supported, ensuring that each has a loop-free path through the network.

  The PVST+ provides Layer 2 load balancing for the VLAN on which it runs. You can create different logical topologies by using the VLANs on your network to ensure that all of your links are used but that no one link is oversubscribed. Each instance of PVST+ on a VLAN has a single root switch. This root switch propagates the spanning-tree information associated with that VLAN to all other switches in the network. Because each switch has the same information about the network, this process ensures that the network topology is maintained.

- **Rapid PVST+**—This spanning-tree mode is the same as PVST+ except that it uses a rapid convergence based on the IEEE 802.1w standard. To provide rapid convergence, the rapid PVST+ immediately deletes dynamically learned MAC address entries on a per-port basis upon receiving a topology change. By contrast, PVST+ uses a short aging time for dynamically learned MAC address entries.

  The rapid PVST+ uses the same configuration as PVST+ (except where noted), and the switch needs only minimal extra configuration. The benefit of rapid PVST+ is that you can migrate a large PVST+ install base to rapid PVST+ without having to learn the complexities of the MSTP configuration and without having to reprovision your network. In rapid-PVST+ mode, each VLAN runs its own spanning-tree instance up to the maximum supported.

- **MSTP**—This spanning-tree mode is based on the IEEE 802.1s standard. You can map multiple VLANs to the same spanning-tree instance, which reduces the number of spanning-tree instances required to support a large number of VLANs. The MSTP runs on top of the RSTP (based on IEEE 802.1w, which provides for rapid convergence of the spanning tree by eliminating the forward delay and by quickly transitioning root ports and designated ports to the forwarding state. You cannot run MSTP without RSTP.

  The most common initial deployment of MSTP is in the backbone and distribution layers of a Layer 2 switched network. For more information, see Chapter 14, “Configuring MSTP.” For information about the number of supported spanning-tree instances, see the next section.

Supported Spanning-Tree Instances

In PVST+ or rapid-PVST+ mode, the switch supports up to 64 spanning-tree instances.

In MSTP mode, the switch supports up to 16 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.

For information about how spanning tree interoperates with the VLAN Trunking Protocol (VTP), see the “Spanning-Tree Configuration Guidelines” section on page 13-11.
Spanning-Tree Interoperability and Backward Compatibility

Table 13-2 lists the interoperability and compatibility among the supported spanning-tree modes in a network.

<table>
<thead>
<tr>
<th></th>
<th>PVST+</th>
<th>MSTP</th>
<th>Rapid PVST+</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVST+</td>
<td>Yes</td>
<td>Yes (with restrictions)</td>
<td>Yes (reverts to PVST+)</td>
</tr>
<tr>
<td>MSTP</td>
<td>Yes (with restrictions)</td>
<td>Yes</td>
<td>Yes (reverts to PVST+)</td>
</tr>
<tr>
<td>Rapid PVST+</td>
<td>Yes (reverts to PVST+)</td>
<td>Yes (reverts to PVST+)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

In a mixed MSTP and PVST+ network, the common spanning-tree (CST) root must be inside the MST backbone, and a PVST+ switch cannot connect to multiple MST regions.

When a network contains switches running rapid PVST+ and switches running PVST+, we recommend that the rapid-PVST+ switches and PVST+ switches be configured for different spanning-tree instances. In the rapid-PVST+ spanning-tree instances, the root switch must be a rapid-PVST+ switch. In the PVST+ instances, the root switch must be a PVST+ switch. The PVST+ switches should be at the edge of the network.

STP and IEEE 802.1Q Trunks

The IEEE 802.1Q standard for VLAN trunks imposes some limitations on the spanning-tree strategy for a network. The standard requires only one spanning-tree instance for all VLANs allowed on the trunks. However, in a network of Cisco switches connected through IEEE 802.1Q trunks, the switches maintain one spanning-tree instance for each VLAN allowed on the trunks.

When you connect a Cisco switch to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco switch uses PVST+ to provide spanning-tree interoperability. If rapid PVST+ is enabled, the switch uses it instead of PVST+. The switch combines the spanning-tree instance of the IEEE 802.1Q VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q switch.

However, all PVST+ or rapid-PVST+ information is maintained by Cisco switches separated by a cloud of non-Cisco IEEE 802.1Q switches. The non-Cisco IEEE 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.

The external spanning-tree behavior on access ports and trunk ports is not affected by PVST+ or rapid PVST+.

For more information on IEEE 802.1Q trunks, see Chapter 16, “Configuring VLANs.”

Configuring Spanning-Tree Features

These sections describe how to configure spanning-tree features:

- Default Spanning-Tree Configuration, page 13-11
- Spanning-Tree Configuration Guidelines, page 13-11
- Changing the Spanning-Tree Mode, page 13-12 (required)
- Disabling Spanning Tree, page 13-13 (optional)
• Configuring the Root Switch, page 13-14 (optional)  
• Configuring a Secondary Root Switch, page 13-16 (optional)  
• Configuring the Port Priority, page 13-17 (optional)  
• Configuring the Path Cost, page 13-18 (optional)  
• Configuring the Switch Priority of a VLAN, page 13-19 (optional)  
• Configuring Spanning-Tree Timers, page 13-20 (optional)  

Default Spanning-Tree Configuration

Table 13-3 shows the default spanning-tree configuration.

<table>
<thead>
<tr>

Forward-delay time: 15 seconds.  
Maximum-aging time: 20 seconds.                                                                        |

Spanning-Tree Configuration Guidelines

If more VLANs are defined in the VTP than there are spanning-tree instances, you can enable PVST+ or rapid PVST+ on only 64 VLANs. If the number of VLANs exceeds 64, we recommend that you enable the MSTP to map multiple VLANs to a single spanning-tree instance. For more information, see Chapter 14, “Configuring MSTP.”
If 64 instances of spanning tree are already in use, you can disable spanning tree on one of the VLANs and then enable it on the VLAN where you want it to run. Use the `no spanning-tree vlan vlan-id` global configuration command to disable spanning tree on a specific VLAN, and use the `spanning-tree vlan vlan-id` global configuration command to enable spanning tree on the desired VLAN.

**Caution**

Switches that are not running spanning tree still forward received BPDUs so that the other switches on the VLAN with a running spanning-tree instance can break loops. Therefore, spanning tree must be running on enough switches to break all the loops in the network. For example, at least one switch on each loop in the VLAN must be running spanning tree. It is not absolutely necessary to run spanning tree on all switches in the VLAN; however, if you are running spanning tree only on a minimal set of switches, an incautious change to the network that introduces another loop into the VLAN can result in a broadcast storm.

If you have already used all available spanning-tree instances on your switch, adding another VLAN anywhere in the VTP domain creates a VLAN that is not running spanning tree on that switch. If you have the default allowed list on the trunk ports of that switch, the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that will not be broken, particularly if there are several adjacent switches that have all run out of spanning-tree instances. You can prevent this possibility by setting up allowed lists on the trunk ports of switches that have used up their allocation of spanning-tree instances. Setting up allowed lists is not necessary in many cases and can make it more labor-intensive to add another VLAN to the network.

Spanning-tree commands determine the configuration of VLAN spanning-tree instances. You create a spanning-tree instance when you assign an interface to a VLAN. The spanning-tree instance is removed when the last interface is moved to another VLAN. You can configure switch and port parameters before a spanning-tree instance is created; these parameters are applied when the spanning-tree instance is created.

The switch supports PVST+, rapid PVST+, and MSTP, but only one version can be active at any time. (For example, all VLANs run PVST+, all VLANs run rapid PVST+, or all VLANs run MSTP.) For information about the different spanning-tree modes and how they interoperate, see the “Spanning-Tree Interoperability and Backward Compatibility” section on page 13-10.

For configuration guidelines about UplinkFast, BackboneFast, and cross-stack UplinkFast, see the “Optional Spanning-Tree Configuration Guidelines” section on page 15-14.

**Caution**

Loop guard works only on point-to-point links. We recommend that each end of the link has a directly connected device that is running STP.

### Changing the Spanning-Tree Mode

The switch supports three spanning-tree modes: PVST+, rapid PVST+, or MSTP. By default, the switch runs the PVST+ protocol.

Beginning in privileged EXEC mode, follow these steps to change the spanning-tree mode. If you want to enable a mode that is different from the default mode, this procedure is required.
Chapter 13 Configuring STP

Configuring Spanning-Tree Features

Configuring Spanning-Tree Features

To return to the default setting, use the `no spanning-tree mode` global configuration command. To return the port to its default setting, use the `no spanning-tree link-type` interface configuration command.

Disabling Spanning Tree

Spanning tree is enabled by default on VLAN 1 and on all newly created VLANs up to the spanning-tree limit specified in the “Supported Spanning-Tree Instances” section on page 13-9. Disable spanning tree only if you are sure there are no loops in the network topology.

Caution

When spanning tree is disabled and loops are present in the topology, excessive traffic and indefinite packet duplication can drastically reduce network performance.
Beginning in privileged EXEC mode, follow these steps to disable spanning tree on a per-VLAN basis. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>no spanning-tree vlan <em>vlan-id</em></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree vlan <em>vlan-id</em></td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To re-enable spanning tree, use the *spanning-tree vlan *vlan-id* global configuration command.

### Configuring the Root Switch

The switch maintains a separate spanning-tree instance for each active VLAN configured on it. A bridge ID, consisting of the switch priority and the switch MAC address, is associated with each instance. For each VLAN, the switch with the lowest bridge ID becomes the root switch for that VLAN.

To configure a switch to become the root for the specified VLAN, use the *spanning-tree vlan *vlan-id* root* global configuration command to modify the switch priority from the default value (32768) to a significantly lower value. When you enter this command, the switch checks the switch priority of the root switches for each VLAN. Because of the extended system ID support, the switch sets its own priority for the specified VLAN to 24576 if this value will cause this switch to become the root for the specified VLAN.

If any root switch for the specified VLAN has a switch priority lower than 24576, the switch sets its own priority for the specified VLAN to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value as shown in Table 13-1 on page 13-4.)

#### Note

The *spanning-tree vlan *vlan-id root* global configuration command fails if the value necessary to be the root switch is less than 1.

Before Cisco IOS Release 12.1(9)EA1, entering the *spanning-tree vlan *vlan-id root* global configuration command on a Catalyst 2950 switch (no extended system ID) caused it to set its own switch priority for the specified VLAN to 8192 if this value caused this switch to become the root for the specified VLAN. If any root switch for the specified VLAN has a switch priority lower than 8192, the switch sets its own priority for the specified VLAN to 1 less than the lowest switch priority.

These examples show the effect of the *spanning-tree vlan *vlan-id root* command with and without the extended system ID support:

- For Catalyst 2950 and Catalyst 2955 switches with the extended system ID (Cisco IOS Release 12.1(9)EA1 and later), if all network devices in VLAN 20 have the default priority of 32768, entering the *spanning-tree vlan 20 root primary* command on the switch sets the switch priority to 24576, which causes this switch to become the root switch for VLAN 20.
For Catalyst 2950 switches without the extended system ID (software earlier than Cisco IOS Release 12.1(9)EA1), if all network devices in VLAN 100 have the default priority of 32768, entering the `spanning-tree vlan 100 root primary` command on the switch sets the switch priority for VLAN 100 to 8192, which causes this switch to become the root switch for VLAN 100.

**Note**

If your network consists of switches that both do and do not support the extended system ID, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches running older software.

**Note**

The root switch for each spanning-tree instance should be a backbone or distribution switch. Do not configure an access switch as the spanning-tree primary root.

Use the `diameter` keyword to specify the Layer 2 network diameter (that is, the maximum number of switch hops between any two end stations in the Layer 2 network). When you specify the network diameter, the switch automatically sets an optimal hello time, forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the `hello` keyword to override the automatically calculated hello time.

**Note**

After configuring the switch as the root switch, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time by using the `spanning-tree vlan vlan-id hello-time`, `spanning-tree vlan vlan-id forward-time`, and the `spanning-tree vlan vlan-id max-age` global configuration commands.

Beginning in privileged EXEC mode, follow these steps to configure a switch to become the root for the specified VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>spanning-tree vlan vlan-id root primary [diameter net-diameter [hello-time seconds]]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
To return the switch to its default setting, use the `no spanning-tree vlan vlan-id root` global configuration command.

### Configuring a Secondary Root Switch

When you configure a Catalyst 2950 or Catalyst 2955 switch that supports the extended system ID as the secondary root, the switch priority is modified from the default value (32768) to 28672. The switch is then likely to become the root switch for the specified VLAN if the primary root switch fails. This is assuming that the other network switches use the default switch priority of 32768 and therefore are unlikely to become the root switch. For Catalyst 2950 switches without the extended system ID support (software earlier than Cisco IOS Release 12.1(9)EA1), the switch priority is changed to 16384.

You can execute this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello-time values as you used when you configured the primary root switch with the `spanning-tree vlan vlan-id root primary` global configuration command.

Beginning in privileged EXEC mode, follow these steps to configure a switch to become the secondary root for the specified VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2** spanning-tree vlan vlan-id root secondary [diameter net-diameter [hello-time seconds]] | Configure a switch to become the secondary root for the specified VLAN.  
  - For `vlan-id`, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.  
  - (Optional) For `diameter net-diameter`, specify the maximum number of switches between any two end stations. The range is 2 to 7.  
  - (Optional) For `hello-time seconds`, specify the interval in seconds between the generation of configuration messages by the root switch. The range is 1 to 10 seconds; the default is 2 seconds.  
  Use the same network diameter and hello-time values that you used when configuring the primary root switch. See the “Configuring the Root Switch” section on page 13-14. |
| **Step 3** end                 | Return to privileged EXEC mode.                    |
| **Step 4** show spanning-tree detail | Verify your entries.                              |
| **Step 5** copy running-config startup-config | (Optional) Save your entries in the configuration file. |
To return the switch to its default setting, use the no spanning-tree vlan vlan-id root global configuration command.

### Configuring the Port Priority

If a loop occurs, spanning tree uses the port priority when selecting an interface to put into the forwarding state. You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

Beginning in privileged EXEC mode, follow these steps to configure the port priority of an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify an interface to configure, and enter interface configuration mode. Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel port-channel-number).</td>
</tr>
<tr>
<td>Step 3 spanning-tree port-priority priority</td>
<td>Configure the port priority for an interface. For priority, the range is 0 to 240 in increments of 16. The default is 128. The lower the number, the higher the priority. Valid priority values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected.</td>
</tr>
<tr>
<td>Step 4 spanning-tree vlan vlan-id port-priority priority</td>
<td>Configure the VLAN port priority for an interface. For vlan-id, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. For priority, the range is 0 to 240 in increments of 16. The default is 128. The lower the number, the higher the priority. Valid priority values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show spanning-tree interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>or show spanning-tree vlan vlan-id</td>
<td></td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
The **show spanning-tree interface** `interface-id` privileged EXEC command displays information only if the port is in a link-up operative state. Otherwise, you can use the **show running-config interface** privileged EXEC command to confirm the configuration.

To return the interface to its default setting, use the **no spanning-tree** `[vlan vlan-id]` **port-priority** interface configuration command. For information on how to configure load sharing on trunk ports by using spanning-tree port priorities, see the “Load Sharing Using STP” section on page 16-20.

### Configuring the Path Cost

The spanning-tree path cost default value is derived from the media speed of an interface. If a loop occurs, spanning tree uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

Beginning in privileged EXEC mode, follow these steps to configure the cost of an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface <code>interface-id</code></td>
<td>Specify an interface to configure, and enter interface configuration mode. Valid interfaces include physical interfaces and port-channel logical interfaces (<code>port-channel port-channel-number</code>).</td>
</tr>
<tr>
<td>Step 3 spanning-tree cost <code>cost</code></td>
<td>Configure the cost for an interface.</td>
</tr>
<tr>
<td></td>
<td>If a loop occurs, spanning tree uses the path cost when selecting an interface to place into the forwarding state. A lower path cost represents higher-speed transmission. For <code>cost</code>, the range is 1 to 200000000; the default value is derived from the media speed of the interface.</td>
</tr>
<tr>
<td>Step 4 spanning-tree vlan <code>vlan-id</code> <code>cost</code></td>

</tbody>
</table>
### Configuring STP

#### Configuring Spanning-Tree Features

The `show spanning-tree interface interface-id` privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the `show running-config` privileged EXEC command to confirm the configuration.

To return the interface to its default setting, use the no `spanning-tree [vlan vlan-id] cost` interface configuration command. For information on how to configure load sharing on trunk ports by using spanning-tree path costs, see the “Load Sharing Using STP” section on page 16-20.

#### Configuring the Switch Priority of a VLAN

You can configure the switch priority and make it more likely that the switch will be chosen as the root switch.

Exercise care when using this command. For most situations, we recommend that you use the `spanning-tree vlan vlan-id root primary` and the `spanning-tree vlan vlan-id root secondary` global configuration commands to modify the switch priority.

Beginning in privileged EXEC mode, follow these steps to configure the switch priority of a VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>show spanning-tree interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td></td>
<td>or show spanning-tree vlan vlan-id</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Note**
The `show spanning-tree interface interface-id` privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the `show running-config` privileged EXEC command to confirm the configuration.

To return the interface to its default setting, use the no `spanning-tree [vlan vlan-id] cost` interface configuration command. For information on how to configure load sharing on trunk ports by using spanning-tree path costs, see the “Load Sharing Using STP” section on page 16-20.

#### Configuring the Switch Priority of a VLAN

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>spanning-tree vlan vlan-id priority priority</td>
<td>Configure the switch priority of a VLAN.</td>
</tr>
<tr>
<td></td>
<td>• For <code>vlan-id</code>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• For <code>priority</code>, the range is 0 to 61440 in increments of 4096; the default is 32768. The lower the number, the more likely the switch will be chosen as the root switch. Valid priority values are 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>show spanning-tree vlan vlan-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To return the switch to its default setting, use the `no spanning-tree vlan vlan-id priority` global configuration command.

## Configuring Spanning-Tree Timers

Table 13-4 describes the timers that affect the entire spanning-tree performance.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hello timer</td>
<td>Determines how often the switch broadcasts hello messages to other switches.</td>
</tr>
<tr>
<td>Forward-delay timer</td>
<td>Determines how long each of the listening and learning states last before the interface begins forwarding.</td>
</tr>
<tr>
<td>Maximum-age timer</td>
<td>Determines the amount of time the switch stores protocol information received on an interface.</td>
</tr>
</tbody>
</table>

The sections that follow provide the configuration steps.

### Configuring the Hello Time

You can configure the interval between the generation of configuration messages by the root switch by changing the hello time.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>spanning-tree vlan vlan-id hello-time seconds</td>
<td>Configure the hello time of a VLAN. The hello time is the interval between the generation of configuration messages by the root switch. These messages mean that the switch is alive.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- For <code>vlan-id</code>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- For <code>seconds</code>, the range is 1 to 10; the default is 2.</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>show spanning-tree vlan vlan-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no spanning-tree vlan vlan-id hello-time` global configuration command.
Configuring the Forwarding-Delay Time for a VLAN

Beginning in privileged EXEC mode, follow these steps to configure the forwarding-delay time for a VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree vlan vlan-id forward-time seconds</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree vlan vlan-id Verify your entries.</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the no spanning-tree vlan vlan-id forward-time global configuration command.

Configuring the Maximum-Aging Time for a VLAN

Beginning in privileged EXEC mode, follow these steps to configure the maximum-aging time for a VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree vlan vlan-id max-age seconds</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree vlan vlan-id Verify your entries.</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the no spanning-tree vlan vlan-id max-age global configuration command.
Configuring Spanning Tree for Use in a Cascaded Stack

Spanning tree uses default values that can be reduced when configuring your switch in cascaded configurations. If a root switch is part of a cluster that is one switch from a cascaded stack, you can customize spanning tree to reconverge more quickly after a switch failure. Figure 13-4 shows switches in three cascaded stacks that use the GigaStack GBIC. Table 13-5 shows the default spanning-tree settings and those that are acceptable for these configurations.

<table>
<thead>
<tr>
<th>STP Parameter</th>
<th>STP Default</th>
<th>Acceptable for Option 1</th>
<th>Acceptable for Option 2</th>
<th>Acceptable for Option 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hello Time</td>
<td>2</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Max Age</td>
<td>20</td>
<td>6</td>
<td>10</td>
<td>6</td>
</tr>
<tr>
<td>Forwarding Delay</td>
<td>15</td>
<td>4</td>
<td>7</td>
<td>4</td>
</tr>
</tbody>
</table>

To return to the default setting, use the `no spanning-tree transmit hold-count value` global configuration command.
Displaying the Spanning-Tree Status

To display the spanning-tree status, use one or more of the privileged EXEC commands in Table 13-6:

Table 13-6 Commands for Displaying Spanning-Tree Status

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree active</td>
<td>Displays spanning-tree information on active interfaces only.</td>
</tr>
<tr>
<td>show spanning-tree detail</td>
<td>Displays a detailed summary of interface information.</td>
</tr>
<tr>
<td>show spanning-tree interface interface-id</td>
<td>Displays spanning-tree information for the specified interface.</td>
</tr>
<tr>
<td>show spanning-tree summary [totals]</td>
<td>Displays a summary of port states or displays the total lines of the STP state section.</td>
</tr>
</tbody>
</table>

You can clear spanning-tree counters by using the clear spanning-tree [interface interface-id] privileged EXEC command.

For information about other keywords for the show spanning-tree privileged EXEC command, see the command reference for this release.
Configuring MSTP

This chapter describes how to configure the Cisco implementation of the IEEE 802.1s Multiple STP (MSTP) on your Catalyst 2950 or Catalyst 2955 switch.

Note

The multiple spanning-tree (MST) implementation is a prestandard implementation. It is based on the draft version of the IEEE standard.

The MSTP enables multiple VLANs to be mapped to the same spanning-tree instance, reducing the number of spanning-tree instances needed to support a large number of VLANs. The MSTP provides for multiple forwarding paths for data traffic and enables load balancing. It improves the fault tolerance of the network because a failure in one instance (forwarding path) does not affect other instances (forwarding paths). The most common initial deployment of MSTP is in the backbone and distribution layers of a Layer 2 switched network. This deployment provides the highly available network required in a service-provider environment.

When the switch is in the MST mode, the Rapid Spanning Tree Protocol (RSTP), which is based on IEEE 802.1w, is automatically enabled. The RSTP provides rapid convergence of the spanning tree through explicit handshaking that eliminates the IEEE 802.1D forwarding delay and quickly transitions root ports and designated ports to the forwarding state.

Both MSTP and RSTP improve the spanning-tree operation and maintain backward-compatibility with equipment that is based on the (original) IEEE 802.1D spanning tree, with existing Cisco-proprietary Multiple Instance STP (MISTP) and with existing Cisco per-VLAN spanning-tree plus (PVST+) and rapid per-VLAN spanning-tree plus (rapid PVST+). For information about PVST+ and rapid PVST+, see Chapter 13, “Configuring STP.” For information about other spanning-tree features such as Port Fast, UplinkFast, root guard, and so forth, see Chapter 15, “Configuring Optional Spanning-Tree Features.”

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Understanding MSTP, page 14-2
- Understanding RSTP, page 14-6
- Configuring MSTP Features, page 14-11
- Displaying the MST Configuration and Status, page 14-22
Understanding MSTP

MSTP, which uses RSTP for rapid convergence, enables VLANs to be grouped into a spanning-tree instance, with each instance having a spanning-tree topology independent of other spanning-tree instances. This architecture provides multiple forwarding paths for data traffic, enables load balancing, and reduces the number of spanning-tree instances required to support a large number of VLANs.

These sections describe how the MSTP works:
- Multiple Spanning-Tree Regions, page 14-2
- IST, CIST, and CST, page 14-2
- Hop Count, page 14-4
- Boundary Ports, page 14-5
- Interoperability with IEEE 802.1D STP, page 14-5

For configuration information, see the “Configuring MSTP Features” section on page 14-11.

Multiple Spanning-Tree Regions

For switches to participate in multiple spanning-tree (MST) instances, you must consistently configure the switches with the same MST configuration information. A collection of interconnected switches that have the same MST configuration comprises an MST region as shown in Figure 14-1 on page 14-4.

The MST configuration determines to which MST region each switch belongs. The configuration includes the name of the region, the revision number, and the MST VLAN-to-instance assignment map. You configure the switch for a region by using the `spanning-tree mst configuration` global configuration command, after which the switch enters the MST configuration mode. From this mode, you can map VLANs to an MST instance by using the `instance` MST configuration command, specify the region name by using the `name` MST configuration command, and set the revision number by using the `revision` MST configuration command.

A region can have one or multiple members with the same MST configuration; each member must be capable of processing RSTP bridge protocol data units (BPDUs). There is no limit to the number of MST regions in a network, but each region can only support up to 16 spanning-tree instances. Instances can be identified by any number in the range from 0 to 15. You can assign a VLAN to only one spanning-tree instance at a time.

IST, CIST, and CST

Unlike PVST+ and rapid PVST+ in which all the spanning-tree instances are independent, the MSTP establishes and maintains two types of spanning trees:
- An internal spanning tree (IST), which is the spanning tree that runs in an MST region.
  Within each MST region, the MSTP maintains multiple spanning-tree instances. Instance 0 is a special instance for a region, known as the internal spanning tree (IST). All other MST instances are numbered from 1 to 15.

The IST is the only spanning-tree instance that sends and receives BPDUs. All of the other spanning-tree instance information is contained in M-records, which are encapsulated within MSTP BPDUs. Because the MSTP BDU carries information for all instances, the number of BPDUs that need to be processed to support multiple spanning-tree instances is significantly reduced.
All MST instances within the same region share the same protocol timers, but each MST instance has its own topology parameters, such as root switch ID, root path cost, and so forth. By default, all VLANs are assigned to the IST.

An MST instance is local to the region; for example, MST instance 1 in region A is independent of MST instance 1 in region B, even if regions A and B are interconnected.

- A common and internal spanning tree (CIST), which is a collection of the ISTs in each MST region, and the common spanning tree (CST) that interconnects the MST regions and single spanning trees.

The spanning tree computed in a region appears as a subtree in the CST that encompasses the entire switched domain. The CIST is formed by the spanning-tree algorithm among switches that support the IEEE 802.1w, IEEE 802.1s, and IEEE 802.1D standards. The CIST in a MST region is the same as the CST outside a region.

For more information, see the “Operations Within an MST Region” section on page 14-3 and the “Operations Between MST Regions” section on page 14-3.

Operations Within an MST Region

The IST connects all the MSTP switches in a region. When the IST converges, the root of the IST becomes the IST master. It is the switch within the region with the lowest switch ID and path cost to the CST root. The IST master also is the CST root if there is only one region in the network. If the CST root is outside the region, one of the MSTP switches at the boundary of the region is selected as the IST master.

When an MSTP switch initializes, it sends BPDUs claiming itself as the root of the CST and the IST master, with both of the path costs to the CST root and to the IST master set to zero. The switch also initializes all of its MST instances and claims to be the root for all of them. If the switch receives superior MST root information (lower switch ID, lower path cost, and so forth) than stored for the switch, it relinquishes its claim as the IST master.

During initialization, a region might have many subregions, each with its own IST master. As switches receive superior IST information, they leave their old subregions and join the new subregion that contains the true IST master. Thus all subregions shrink, except for the one that contains the true IST master.

For correct operation, all switches in the MST region must agree on the same IST master. Therefore, any two switches in the region synchronize their port roles for an MST instance only if they converge to a common IST master.

Operations Between MST Regions

If there are multiple regions or legacy IEEE 802.1D switches within the network, MSTP establishes and maintains the CST, which includes all MST regions and all legacy STP switches in the network. The MST instances combine with the IST at the boundary of the region to become the CST.

The IST connects all the MSTP switches in the region and appears as a subtree in the CST that encompasses the entire switched domain, with the root of the subtree being the IST master. The MST region appears as a virtual switch to adjacent STP switches and MST regions.

Figure 15-1 shows a network with three MST regions and a legacy IEEE 802.1D switch (D). The IST master for region 1 (A) is also the CST root. The IST master for region 2 (B) and the IST master for region 3 (C) are the roots for their respective subtrees within the CST. The RSTP runs in all regions.
Understanding MSTP

Figure 14-1 does not show additional MST instances for each region. Note that the topology of MST instances can be different from that of the IST for the same region.

Only the CST instance sends and receives BPDUs, and MST instances add their spanning-tree information into the BPDUs to interact with neighboring switches and compute the final spanning-tree topology. Because of this, the spanning-tree parameters related to BPU transmission (for example, hello time, forward time, max-age, and max-hops) are configured only on the CST instance but affect all MST instances. Parameters related to the spanning-tree topology (for example, switch priority, port VLAN cost, port VLAN priority) can be configured on both the CST instance and the MST instance.

MSTP switches use version 3 RSTP BPDUs or IEEE 802.1D STP BPDUs to communicate with legacy IEEE 802.1D switches. MSTP switches use MSTP BPDUs to communicate with MSTP switches.

Hop Count

The IST and MST instances do not use the message-age and maximum-age information in the configuration BPDU to compute the spanning-tree topology. Instead, they use the path cost to the root and a hop-count mechanism similar to the IP time-to-live (TTL) mechanism.

By using the spanning-tree mst max-hops global configuration command, you can configure the maximum hops inside the region and apply it to the IST and all MST instances in that region. The hop count achieves the same result as the message-age information (determines when to trigger a reconfiguration). The root switch of the instance always sends a BPDU (or M-record) with a cost of 0 and the hop count set to the maximum value. When a switch receives this BPDU, it decrements the
ceived remaining hop count by one and propagates this value as the remaining hop count in the BPDU.
it generates. When the count reaches zero, the switch discards the BPDU and ages the information held
for the port.

The message-age and maximum-age information in the RSTP portion of the BPDU remain the same
throughout the region, and the same values are propagated by the region designated ports at the
boundary.

### Boundary Ports

A boundary port connects an MST region to a single spanning-tree region running RSTP, to a single
spanning-tree region running PVST+ or rapid PVST+, or to another MST region with a different MST
configuration. A boundary port also connects to a LAN, the designated switch of which is either a single
spanning-tree switch or a switch with a different MST configuration.

At the boundary, the roles of the MST ports do not matter, and their state is forced to be the same as the
IST port state (MST ports at the boundary are in the forwarding state only when the IST port is
forwarding). An IST port at the boundary can have any port role except a backup port role.

On a shared boundary link, the MST ports wait in the blocking state for the forward-delay time to expire
before transitioning to the learning state. The MST ports wait another forward-delay time before
transitioning to the forwarding state.

If the boundary port is on a point-to-point link and it is the IST root port, the MST ports transition to the
forwarding state as soon as the IST port transitions to the forwarding state.

If the IST port is a designated port on a point-to-point link and if the IST port transitions to the
forwarding state because of an agreement received from its peer port, the MST ports also immediately
transition to the forwarding state.

If a boundary port transitions to the forwarding state in an IST instance, it is forwarding in all MST
instances, and a topology change is triggered. If a boundary port with the IST root or designated port
role receives a topology change notice external to the MST cloud, the MSTP switch triggers a topology
change in the IST instance and in all the MST instances active on that port.

### Interoperability with IEEE 802.1D STP

A switch running MSTP supports a built-in protocol migration mechanism that enables it to interoperate
with legacy IEEE 802.1D switches. If this switch receives a legacy IEEE 802.1D configuration BPDU
(a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDUs on that port. An MSTP
switch can also detect that a port is at the boundary of a region when it receives a legacy BPDU, an MSTP
BPDU (version 3) associated with a different region, or an RSTP BPDU (version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives IEEE
802.1D BPDUs because it cannot determine whether the legacy switch has been removed from the link
unless the legacy switch is the designated switch. A switch might also continue to assign a boundary role
to a port when the switch to which this switch is connected has joined the region. To restart the protocol
migration process (force the renegotiation with neighboring switches), use the `clear spanning-tree
detected-protocols` privileged EXEC command.

If all the legacy switches on the link are RSTP switches, they can process MSTP BPDUs as if they are
RSTP BPDUs. Therefore, MSTP switches send either a version 0 configuration and TCN BPDUs or
version 3 MSTP BPDUs on a boundary port. A boundary port connects to a LAN, the designated switch
of which is either a single spanning-tree switch or a switch with a different MST configuration.
Understanding RSTP

The RSTP takes advantage of point-to-point wiring and provides rapid convergence of the spanning tree. Reconfiguration of the spanning tree can occur in less than 1 second (in contrast to 50 seconds with the default settings in the IEEE 802.1D spanning tree).

These section describes how the RSTP works:

- Port Roles and the Active Topology, page 14-6
- Rapid Convergence, page 14-7
- Synchronization of Port Roles, page 14-8
- Bridge Protocol Data Unit Format and Processing, page 14-9

For configuration information, see the “Configuring MSTP Features” section on page 14-11.

Port Roles and the Active Topology

The RSTP provides rapid convergence of the spanning tree by assigning port roles and by determining the active topology. The RSTP builds upon the IEEE 802.1D STP to select the switch with the highest switch priority (lowest numerical priority value) as the root switch as described in the “Spanning-Tree Topology and BPDUs” section on page 13-2. Then the RSTP assigns one of these port roles to individual ports:

- Root port—Provides the best path (lowest cost) when the switch forwards packets to the root switch.
- Designated port—Connects to the designated switch, which incurs the lowest path cost when forwarding packets from that LAN to the root switch. The port through which the designated switch is attached to the LAN is called the designated port.
- Alternate port—Offers an alternate path toward the root switch to that provided by the current root port.
- Backup port—Acts as a backup for the path provided by a designated port toward the leaves of the spanning tree. A backup port can exist only when two ports are connected in a loopback by a point-to-point link or when a switch has two or more connections to a shared LAN segment.
- Disabled port—Has no role within the operation of the spanning tree.

A port with the root or a designated port role is included in the active topology. A port with the alternate or backup port role is excluded from the active topology.

In a stable topology with consistent port roles throughout the network, the RSTP ensures that every root port and designated port immediately transition to the forwarding state while all alternate and backup ports are always in the discarding state (equivalent to blocking in IEEE 802.1D). The port state controls the operation of the forwarding and learning processes. Table 14-1 provides a comparison of IEEE 802.1D and RSTP port states.

<table>
<thead>
<tr>
<th>Operational Status</th>
<th>STP Port State (IEEE 802.1D)</th>
<th>RSTP Port State</th>
<th>Is Port Included in the Active Topology?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Blocking</td>
<td>Discarding</td>
<td>No</td>
</tr>
<tr>
<td>Enabled</td>
<td>Listening</td>
<td>Discarding</td>
<td>No</td>
</tr>
<tr>
<td>Enabled</td>
<td>Learning</td>
<td>Learning</td>
<td>Yes</td>
</tr>
</tbody>
</table>
To be consistent with Cisco STP implementations, this guide defines the port state as *blocking* instead of *discarding*. Designated ports start in the listening state.

**Rapid Convergence**

The RSTP provides for rapid recovery of connectivity following the failure of a switch, a switch port, or a LAN. It provides rapid convergence for edge ports, new root ports, and ports connected through point-to-point links as follows:

- **Edge ports**—If you configure a port as an edge port on an RSTP switch by using the `spanning-tree portfast` interface configuration command, the edge port immediately transitions to the forwarding state. An edge port is the same as a Port Fast-enabled port, and you should enable it only on ports that connect to a single end station.

- **Root ports**—If the RSTP selects a new root port, it blocks the old root port and immediately transitions the new root port to the forwarding state.

- **Point-to-point links**—If you connect a port to another port through a point-to-point link and the local port becomes a designated port, it negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology.

As shown in Figure 14-2, Switch A is connected to Switch B through a point-to-point link, and all of the ports are in the blocking state. Assume that the priority of Switch A is a smaller numerical value than the priority of Switch B. Switch A sends a proposal message (a configuration BPDU) with the proposal flag set) to Switch B, proposing itself as the designated switch.

After receiving the proposal message, Switch B selects as its new root port the port from which the proposal message was received, forces all nonedge ports to the blocking state, and sends an agreement message (a BPDU with the agreement flag set) through its new root port.

After receiving Switch B’s agreement message, Switch A also immediately transitions its designated port to the forwarding state. No loops in the network are formed because Switch B blocked all of its nonedge ports and because there is a point-to-point link between Switches A and B.

When Switch C is connected to Switch B, a similar set of handshaking messages are exchanged. Switch C selects the port connected to Switch B as its root port, and both ends immediately transition to the forwarding state. With each iteration of this handshaking process, one more switch joins the active topology. As the network converges, this proposal-agreement handshaking progresses from the root toward the leaves of the spanning tree.

The switch determines the link type from the port duplex mode: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. You can override the default setting that is determined by the duplex setting by using the `spanning-tree link-type` interface configuration command.

Synchronization of Port Roles

When the switch receives a proposal message on one of its ports and that port is selected as the new root port, the RSTP forces all other ports to synchronize with the new root information.

The switch is synchronized with superior root information received on the root port if all other ports are synchronized. An individual port on the switch is synchronized if

- That port is in the blocking state
- It is an edge port (a port configured to be at the edge of the network)

If a designated port is in the forwarding state and is not configured as an edge port, it transitions to the blocking state when the RSTP forces it to synchronize with new root information. In general, when the RSTP forces a port to synchronize with root information and the port does not satisfy any of the above conditions, its port state is set to blocking.

After ensuring that all of the ports are synchronized, the switch sends an agreement message to the designated switch corresponding to its root port. When the switches connected by a point-to-point link are in agreement about their port roles, the RSTP immediately transitions the port states to forwarding. The sequence of events is shown in Figure 14-3.
Figure 14-3  Sequence of Events During Rapid Convergence

The RSTP BPDU format is the same as the IEEE 802.1D BPDU format except that the protocol version is set to 2. A new 1-byte version 1 Length field is set to zero, which means that no version 1 protocol information is present. Table 14-2 shows the RSTP flag fields.

Table 14-2  RSTP BPDU Flags

</tbody>
</table>

The sending switch sets the proposal flag in the RSTP BPDU to propose itself as the designated switch on that LAN. The port role in the proposal message is always set to the designated port.

The sending switch sets the agreement flag in the RSTP BPDU to accept the previous proposal. The port role in the agreement message is always set to the root port.
The RSTP does not have a separate topology change notification (TCN) BPDU. It uses the topology change (TC) flag to show the topology changes. However, for interoperability with IEEE 802.1D switches, the RSTP switch processes and generates TCN BPDUs.

The learning and forwarding flags are set according to the state of the sending port.

**Processing Superior BPDU Information**

If a port receives superior root information (lower switch ID, lower path cost, and so forth) than currently stored for the port, the RSTP triggers a reconfiguration. If the port is proposed and is selected as the new root port, RSTP forces all the other ports to synchronize.

If the BPDU received is an RSTP BPDU with the proposal flag set, the switch sends an agreement message after all of the other ports are synchronized. If the BPDU is an IEEE 802.1D BPDU, the switch does not set the proposal flag and starts the forward-delay timer for the port. The new root port requires twice the forward-delay time to transition to the forwarding state.

If the superior information received on the port causes the port to become a backup or alternate port, RSTP sets the port to the blocking state but does not send the agreement message. The designated port continues sending BPDUs with the proposal flag set until the forward-delay timer expires, at which time the port transitions to the forwarding state.

**Processing Inferior BPDU Information**

If a designated port receives an inferior BPDU (higher switch ID, higher path cost, and so forth than currently stored for the port) with a designated port role, it immediately replies with its own information.

**Topology Changes**

This section describes the differences between the RSTP and the IEEE 802.1D in handling spanning-tree topology changes.

- **Detection**—Unlike IEEE 802.1D in which any transition between the blocking and the forwarding state causes a topology change, only transitions from the blocking to the forwarding state cause a topology change with RSTP (only an increase in connectivity is considered a topology change). State changes on an edge port do not cause a topology change. When an RSTP switch detects a topology change, it deletes the learned information on all of its nonedge ports except on those from which it received the TC notification.

- **Notification**—Unlike IEEE 802.1D, which uses TCN BPDUs, the RSTP does not use them. However, for IEEE 802.1D interoperability, an RSTP switch processes and generates TCN BPDUs.

- **Acknowledgement**—When an RSTP switch receives a TCN message on a designated port from an IEEE 802.1D switch, it replies with an IEEE 802.1D configuration BPDU with the TCA bit set. However, if the TC-while timer (the same as the topology-change timer in IEEE 802.1D) is active on a root port connected to an IEEE 802.1D switch and a configuration BPDU with the TCA bit set is received, the TC-while timer is reset. This behavior is only required to support IEEE 802.1D switches. The RSTP BPDUs never have the TCA bit set.

- **Propagation**—When an RSTP switch receives a TC message from another switch through a designated or root port, it propagates the change to all of its nonedge, designated ports and to the root port (excluding the port on which it is received). The switch starts the TC-while timer for all such ports and flushes the information learned on them.
Protocol migration—For backward compatibility with IEEE 802.1D switches, RSTP selectively sends IEEE 802.1D configuration BPDUs and TCN BPDUs on a per-port basis.

When a port is initialized, the migrate-delay timer is started (specifies the minimum time during which RSTP BPDUs are sent), and RSTP BPDUs are sent. While this timer is active, the switch processes all BPDUs received on that port and ignores the protocol type.

If the switch receives an IEEE 802.1D BPDU after the port migration-delay timer has expired, it assumes that it is connected to an IEEE 802.1D switch and starts using only IEEE 802.1D BPDUs. However, if the RSTP switch is using IEEE 802.1D BPDUs on a port and receives an RSTP BPDU after the timer has expired, it restarts the timer and starts using RSTP BPDUs on that port.

Configuring MSTP Features

These sections describe how to configure basic MSTP features:

- Default MSTP Configuration, page 14-11
- MSTP Configuration Guidelines, page 14-12

For information about the supported number of spanning-tree instances, see the “Supported Spanning-Tree Instances” section on page 13-9.

MSTP Configuration Guidelines

These are the configuration guidelines for MSTP:

- When you enable MST by using the `spanning-tree mode mst` global configuration command, RSTP is automatically enabled. Per-VLAN RSTP is not supported in software releases earlier than Cisco IOS Release 12.1(13)EA1.

- For two or more switches to be in the same MST region, they must have the same VLAN-to-instance map, the same configuration revision number, and the same name.

- The switch supports up to 16 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.

- PVST+, rapid PVST+, and MSTP are supported, but only one version can be active at any time. (For example, all VLANs run PVST+, all VLANs run rapid PVST+, or all VLANs run MSTP.) For more information, see the “Spanning-Tree Interoperability and Backward Compatibility” section on page 13-10.

- VTP propagation of the MST configuration is not supported. However, you can manually configure the MST configuration (region name, revision number, and VLAN-to-instance mapping) on each switch within the MST region by using the command-line interface (CLI) or through the SNMP support.

- For load balancing across redundant paths in the network to work, all VLAN-to-instance mapping assignments must match; otherwise, all traffic flows on a single link.

- All MST boundary ports must be forwarding for load balancing between a PVST+ and an MST cloud or between a rapid-PVST+ and an MST cloud. For this to occur, the IST master of the MST cloud should also be the root of the CST. If the MST cloud consists of multiple MST regions, one of the MST regions must contain the CST root, and all of the other MST regions must have a better path to the root contained within the MST cloud than a path through the PVST+ or rapid-PVST+ cloud. You might have to manually configure the switches in the clouds.

- Partitioning the network into a large number of regions is not recommended. However, if this situation is unavoidable, we recommend that you partition the switched LAN into smaller LANs interconnected by routers or non-Layer 2 devices.

- For configuration guidelines about UplinkFast, BackboneFast, and cross-stack UplinkFast, see the “Optional Spanning-Tree Configuration Guidelines” section on page 15-14.
Specifying the MST Region Configuration and Enabling MSTP

For two or more switches to be in the same MST region, they must have the same VLAN-to-instance mapping, the same configuration revision number, and the same name.

A region can have one member or multiple members with the same MST configuration; each member must be capable of processing RSTP BPDUs. There is no limit to the number of MST regions in a network, but each region can only support up to 16 spanning-tree instances. You can assign a VLAN to only one spanning-tree instance at a time.

Beginning in privileged EXEC mode, follow these steps to specify the MST region configuration and enable MSTP. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree mst configuration</td>
</tr>
<tr>
<td>Step 3</td>
<td>instance instance-id vlan vlan-range</td>
</tr>
<tr>
<td></td>
<td>• For instance-id, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 1 to 15.</td>
</tr>
<tr>
<td></td>
<td>• For vlan vlan-range, the range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>When you map VLANs to an MST instance, the mapping is incremental, and the VLANs specified in the command are added to or removed from the VLANs that were previously mapped.</td>
</tr>
<tr>
<td></td>
<td>To specify a VLAN range, use a hyphen; for example, instance 1 vlan 1-63 maps VLANs 1 through 63 to MST instance 1.</td>
</tr>
<tr>
<td></td>
<td>To specify a VLAN series, use a comma; for example, instance 1 vlan 10, 20, 30 maps VLANs 10, 20, and 30 to MST instance 1.</td>
</tr>
<tr>
<td>Step 4</td>
<td>name name</td>
</tr>
<tr>
<td>Step 5</td>
<td>revision version</td>
</tr>
<tr>
<td>Step 6</td>
<td>show pending</td>
</tr>
<tr>
<td>Step 7</td>
<td>exit</td>
</tr>
<tr>
<td>Step 8</td>
<td>spanning-tree mode mst</td>
</tr>
<tr>
<td></td>
<td>Caution</td>
</tr>
<tr>
<td></td>
<td>You cannot run both MSTP and PVST+ or both MSTP and rapid PVST+ at the same time.</td>
</tr>
<tr>
<td>Step 9</td>
<td>end</td>
</tr>
<tr>
<td>Step 10</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 11</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
To return to the default MST region configuration, use the `no spanning-tree mst configuration` global configuration command. To return to the default VLAN-to-instance map, use the `no instance instance-id [vlan vlan-range]` MST configuration command. To return to the default name, use the `no name MST` configuration command. To return to the default revision number, use the `no revision MST` configuration command. To re-enable PVST+, use the `no spanning-tree mode` or the `spanning-tree mode pvst` global configuration command.

This example shows how to enter MST configuration mode, map VLANs 10 to 20 to MST instance 1, name the region `region1`, set the configuration revision to 1, display the pending configuration, apply the changes, and return to global configuration mode:

```
Switch(config)# spanning-tree mst configuration
Switch(config-mst)# instance 1 vlan 10-20
Switch(config-mst)# name region1
Switch(config-mst)# revision 1
Switch(config-mst)# show pending
Pending MST configuration
Name     [region1]
Revision  1
Instance  Vlans Mapped
--------- ---------------------
0         1-9,21-4094
1         10-20

Switch(config-mst)# exit
Switch(config)#
```

### Configuring the Root Switch

The switch maintains a spanning-tree instance for the group of VLANs mapped to it. A switch ID, consisting of the switch priority and the switch MAC address, is associated with each instance. The switch with the lowest switch ID becomes the root switch for the group of VLANs.

To configure a switch to become the root, use the `spanning-tree mst instance-id root` global configuration command to modify the switch priority from the default value (32768) to a significantly lower value so that the switch becomes the root switch for the specified spanning-tree instance. When you enter this command, the switch checks the switch priorities of the root switches. Because of the extended system ID support, the switch sets its own priority for the specified instance to 24576 if this value will cause this switch to become the root for the specified spanning-tree instance. If any root switch for the specified instance has a switch priority lower than 24576, the switch sets its own priority to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value as shown in Table 13-1 on page 13-4.)

**Note**

Catalyst 2950 switches running software earlier than Cisco IOS Release 12.1(9)EA1 do not support the extended system ID. Catalyst 2950 switches running software earlier than Cisco IOS Release 12.1(9)EA1 do not support the MSTP.

If your network consists of switches that both do and do not support the extended system ID, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches running older software.

The root switch for each spanning-tree instance should be a backbone or distribution switch. Do not configure an access switch as the spanning-tree primary root.
Use the `diameter` keyword, which is available only for MST instance 0, to specify the Layer 2 network diameter (that is, the maximum number of switch hops between any two end stations in the Layer 2 network). When you specify the network diameter, the switch automatically sets an optimal hello time, forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the `hello` keyword to override the automatically calculated hello time.

**Note**

After configuring the switch as the root switch, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time by using the `spanning-tree mst hello-time`, `spanning-tree mst forward-time`, and `spanning-tree mst max-age` global configuration commands after configuring the switch as the root switch.

Beginning in privileged EXEC mode, follow these steps to configure a switch as the root switch. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| `spanning-tree mst instance-id root primary [diameter net-diameter [hello-time seconds]]` | Configure a switch as the root switch.  
- For `instance-id`, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 15.  
- (Optional) For `diameter net-diameter`, specify the maximum number of switches between any two end stations. The range is 2 to 7. This keyword is available only for MST instance 0.  
- (Optional) For `hello-time seconds`, specify the interval in seconds between the generation of configuration messages by the root switch. The range is 1 to 10 seconds; the default is 2 seconds. |
| `end` | Return to privileged EXEC mode. |
| `show spanning-tree mst instance-id` | Verify your entries. |
| `copy running-config startup-config` | (Optional) Save your entries in the configuration file. |

To return the switch to its default setting, use the `no spanning-tree mst instance-id root` global configuration command.

### Configuring a Secondary Root Switch

When you configure a Catalyst 2950 or Catalyst 2955 switch that supports the extended system ID as the secondary root, the spanning-tree switch priority is modified from the default value (32768) to 28672. The switch is then likely to become the root switch for the specified instance if the primary root switch fails. This is assuming that the other network switches use the default switch priority of 32768 and therefore are unlikely to become the root switch. For Catalyst 2950 switches without the extended system ID support (software earlier than Cisco IOS Release 12.1(9)EA1), the switch priority is changed to 16384.
You can execute this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello-time values that you used when you configured the primary root switch with the `spanning-tree mst instance-id root primary` global configuration command.

Beginning in privileged EXEC mode, follow these steps to configure a switch as the secondary root switch. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree mst instance-id root secondary [diameter net-diameter [hello-time seconds]]</td>
</tr>
<tr>
<td></td>
<td>• For instance-id, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 15.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For diameter net-diameter, specify the maximum number of switches between any two end stations. The range is 2 to 7. This keyword is available only for MST instance 0.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For hello-time seconds, specify the interval in seconds between the generation of configuration messages by the root switch. The range is 1 to 10 seconds; the default is 2 seconds.</td>
</tr>
<tr>
<td></td>
<td>Use the same network diameter and hello-time values that you used when configuring the primary root switch. See the “Configuring the Root Switch” section on page 14-14.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree mst instance-id</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no spanning-tree mst instance-id root` global configuration command.

**Configuring the Port Priority**

If a loop occurs, the MSTP uses the port priority when selecting an interface to put into the forwarding state. You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.
Beginning in privileged EXEC mode, follow these steps to configure the MSTP port priority of an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specify an interface to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Valid interfaces include physical ports and port channels.</td>
</tr>
<tr>
<td></td>
<td>Valid port-channel numbers are 1 to 6.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>spanning-tree mst instance-id port-priority priority</td>
</tr>
<tr>
<td></td>
<td>Configure the port priority for an MST instance.</td>
</tr>
<tr>
<td></td>
<td>• For <em>instance-id</em>, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 15.</td>
</tr>
<tr>
<td></td>
<td>• For <em>priority</em>, the range is 0 to 240 in increments of 16. The default is 128. The lower the number, the higher the priority.</td>
</tr>
<tr>
<td></td>
<td>Valid priority values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>show spanning-tree mst interface interface-id</td>
</tr>
<tr>
<td>or</td>
<td>show spanning-tree mst instance-id</td>
</tr>
<tr>
<td></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td><em>(Optional)</em> Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Note**

The *show spanning-tree mst interface interface-id* privileged EXEC command displays information only if the port is in a link-up operative state. Otherwise, you can use the *show running-config interface* privileged EXEC command to confirm the configuration.

To return the interface to its default setting, use the *no spanning-tree mst instance-id port-priority* interface configuration command.

### Configuring the Path Cost

The MSTP path cost default value is derived from the media speed of an interface. If a loop occurs, the MSTP uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

Beginning in privileged EXEC mode, follow these steps to configure the MSTP cost of an interface. This procedure is optional.

**Command** | **Purpose**
---|---
**Step 1** | configure terminal |
| | Enter global configuration mode. |
| **Step 2** | interface interface-id |
| | Specify an interface to configure, and enter interface configuration mode. |
| | Valid interfaces include physical ports and port channels. |
| | Valid port-channel numbers are 1 to 6. |
| **Step 3** | spanning-tree mst instance-id port-priority priority |
| | Configure the path cost for an MST instance. |
| | • For *instance-id*, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 15. |
| | • For *priority*, the range is 0 to 240 in increments of 16. The default is 128. The lower the number, the higher the priority. |
| | Valid priority values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected. |
| **Step 4** | end |
| | Return to privileged EXEC mode. |
| **Step 5** | show spanning-tree mst interface interface-id |
| or | show spanning-tree mst instance-id |
| | Verify your entries. |
| **Step 6** | copy running-config startup-config |
| | *(Optional)* Save your entries in the configuration file. |
### Configuring MSTP Features

**Note**
The `show spanning-tree mst interface interface-id` privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the `show running-config` privileged EXEC command to confirm the configuration.

To return the interface to its default setting, use the `no spanning-tree mst instance-id cost` interface configuration command.

#### Configuring the Switch Priority

You can configure the switch priority and make it more likely that the switch will be chosen as the root switch.

**Note**
Exercise care when using this command. For most situations, we recommend that you use the `spanning-tree mst instance-id root primary` and the `spanning-tree mst instance-id root secondary` global configuration commands to modify the switch priority.
Beginning in privileged EXEC mode, follow these steps to configure the switch priority. This procedure is optional.

</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the **no spanning-tree mst instance-id priority** global configuration command.

### Configuring the Hello Time

You can configure the interval between the generation of configuration messages by the root switch by changing the hello time.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree mst hello-time seconds</td>
</tr>
<tr>
<td></td>
<td>Configure the hello time for all MST instances. The hello time</td>

</tr>
<tr>
<td></td>
<td>For seconds, the range is 1 to 10; the default is 2.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
</tbody>
</table>

Exercise care when using this command. For most situations, we recommend that you use the **spanning-tree mst instance-id root primary** and the **spanning-tree mst instance-id root secondary** global configuration commands to modify the hello time.

Beginning in privileged EXEC mode, follow these steps to configure the hello time for all MST instances. This procedure is optional.
To return the switch to its default setting, use the `no spanning-tree mst hello-time` global configuration command.

## Configuring the Forwarding-Delay Time

Beginning in privileged EXEC mode, follow these steps to configure the forwarding-delay time for all MST instances. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree mst forward-time <code>seconds</code></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree mst</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no spanning-tree mst forward-time` global configuration command.

## Configuring the Maximum-Aging Time

Beginning in privileged EXEC mode, follow these steps to configure the maximum-aging time for all MST instances. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree mst max-age <code>seconds</code></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree mst</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
To return the switch to its default setting, use the **no spanning-tree mst max-age** global configuration command.

**Configuring the Maximum-Hop Count**

Beginning in privileged EXEC mode, follow these steps to configure the maximum-hop count for all MST instances. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree mst max-hops <em>hop-count</em></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree mst</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the **no spanning-tree mst max-hops** global configuration command.

**Specifying the Link Type to Ensure Rapid Transitions**

If you connect a port to another port through a point-to-point link and the local port becomes a designated port, the RSTP negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology as described in the “Rapid Convergence” section on page 14-7.

By default, the link type is determined from the duplex mode of the interface: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. If you have a half-duplex link physically connected point-to-point to a single port on a remote switch running MSTP, you can override the default setting of the link type and enable rapid transitions to the forwarding state.

Beginning in privileged EXEC mode, follow these steps to override the default link-type setting. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface <em>interface-id</em></td>
</tr>
<tr>
<td>Step 3</td>
<td>spanning-tree link-type point-to-point</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
</tbody>
</table>
Restarting the Protocol Migration Process

A switch running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D switches. If this switch receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDUs on that port. An MSTP switch can also detect that a port is at the boundary of a region when it receives a legacy BPDU, an MST BPDU (version 3) associated with a different region, or an RST BPDU (version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot determine whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch also might continue to assign a boundary role to a port when the switch to which it is connected has joined the region.

To restart the protocol migration process (force the renegotiation with neighboring switches) on the switch, use the clear spanning-tree detected-protocols privileged EXEC command.

To restart the protocol migration process on a specific interface, use the clear spanning-tree detected-protocols interface interface-id privileged EXEC command.

Displaying the MST Configuration and Status

To display the spanning-tree status, use one or more of the privileged EXEC commands in Table 14-4:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree mst configuration</td>
<td>Displays the MST region configuration.</td>
</tr>
<tr>
<td>show spanning-tree mst instance-id</td>
<td>Displays MST information for the specified instance.</td>
</tr>
<tr>
<td>show spanning-tree mst interface interface-id</td>
<td>Displays MST information for the specified interface. Valid interfaces include physical ports, VLANs, and port channels. Valid VLAN IDs are 1 to 4094. The valid port-channel range is 1 to 6.</td>
</tr>
</tbody>
</table>

For information about other keywords for the show spanning-tree privileged EXEC command, see the command reference for this release.
CHAPTER 15

Configuring Optional Spanning-Tree Features

This chapter describes how to configure optional spanning-tree features on your Catalyst 2950 or Catalyst 2955 switch. You can configure all of these features when your switch is running the per-VLAN spanning-tree plus (PVST+). You can configure only the noted features when your switch is running the Multiple Spanning Tree Protocol (MSTP) or the rapid per-VLAN spanning-tree plus (rapid-PVST+) protocol.

For information on configuring the PVST+ and rapid PVST+, see Chapter 13, “Configuring STP.” For information about the Multiple Spanning Tree Protocol (MSTP) and how to map multiple VLANs to the same spanning-tree instance, see Chapter 14, “Configuring MSTP.”

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Understanding Optional Spanning-Tree Features, page 15-1
- Configuring Optional Spanning-Tree Features, page 15-13
- Displaying the Spanning-Tree Status, page 15-21

Understanding Optional Spanning-Tree Features

These sections describe how the optional spanning-tree features work:

- Understanding Port Fast, page 15-2
- Understanding BPDU Guard, page 15-2
- Understanding BPDU Filtering, page 15-3
- Understanding UplinkFast, page 15-3
- Understanding Cross-Stack UplinkFast, page 15-5
- Understanding BackboneFast, page 15-9
- Understanding EtherChannel Guard, page 15-11
- Understanding Root Guard, page 15-12
- Understanding Loop Guard, page 15-13
Understanding Port Fast

Port Fast immediately brings an interface configured as an access or trunk port from a blocking state to the forwarding state, bypassing the listening and learning states. You can use Port Fast on ports connected to a single workstation or server, as shown in Figure 15-1, to allow those devices to immediately connect to the network, rather than waiting for the spanning tree to converge.

Ports connected to a single workstation or server should not receive bridge protocol data units (BPDUs). A port with Port Fast enabled goes through the normal cycle of spanning-tree status changes when the switch is restarted.

**Note**
Because the purpose of Port Fast is to minimize the time ports must wait for spanning-tree to converge, it is effective only when used on ports connected to end stations. If you enable Port Fast on a port connected to another switch, you risk creating a spanning-tree loop.

You can enable this feature by using the `spanning-tree portfast` interface configuration or the `spanning-tree portfast default` global configuration command.

**Figure 15-1** Port Fast-Enabled Ports

Understanding BPDU Guard

The BPDU guard feature can be globally enabled on the switch or can be enabled per interface, but the feature operates with some differences.

At the global level, you can enable BPDU guard on Port Fast-enabled ports by using the `spanning-tree portfast bpduguard default` global configuration command. Spanning tree shuts down ports that are in a Port Fast-operational state if any BPDU is received on those interfaces. In a valid configuration, Port Fast-enabled ports do not receive BPDUs. Receiving a BPDU on a Port Fast-enabled port signals an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the port in the error-disabled state.

At the interface level, you can enable BPDU guard on any port by using the `spanning-tree bpduguard enable` interface configuration command without also enabling the Port Fast feature. When the port receives a BPDU, it is put in the error-disabled state.
The BPDU guard feature provides a secure response to invalid configurations because you must manually put the port back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

You can enable the BPDU guard feature for the entire switch or for an interface.

**Understanding BPDU Filtering**

The BPDU filtering feature can be globally enabled on the switch or can be enabled per interface, but the feature operates with some differences.

At the global level, you can enable BPDU filtering on Port Fast-enabled ports by using the `spanning-tree portfast bpdufilter default` global configuration command. This command prevents ports that are in a Port Fast-operational state from sending or receiving BPDUs. The ports still send a few BPDUs at link-up before the switch begins to filter outbound BPDUs. You should globally enable BPDU filtering on a switch so that hosts connected to these ports do not receive BPDUs. If a BPDU is received on a Port Fast-enabled port, the port loses its Port Fast-operational status, and BPDU filtering is disabled.

At the interface level, you can enable BPDU filtering on any port without also enabling the Port Fast feature by using the `spanning-tree bpdufilter enable` interface configuration command. This command prevents the port from sending or receiving BPDUs.

⚠️ **Caution**

Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

You can enable the BPDU filtering feature for the entire switch or for an interface.

**Understanding UplinkFast**

Switches in hierarchical networks can be grouped into backbone switches, distribution switches, and access switches. Figure 15-2 shows a complex network where distribution switches and access switches each have at least one redundant link that spanning tree blocks to prevent loops.
Understanding Optional Spanning-Tree Features

If a switch loses connectivity, it begins using the alternate paths as soon as the spanning tree selects a new root port. By enabling UplinkFast with the `spanning-tree uplinkfast` global configuration command, you can accelerate the choice of a new root port when a link or switch fails or when the spanning tree reconfigures itself. The root port transitions to the forwarding state immediately without going through the listening and learning states, as it would with the normal spanning-tree procedures. When the spanning tree reconfigures the new root port, other interfaces flood the network with multicast packets, one for each address that was learned on the interface. You can limit these bursts of multicast traffic by reducing the `max-update-rate` parameter (the default for this parameter is 150 packets per second). However, if you enter zero, station-learning frames are not generated, so the spanning-tree topology converges more slowly after a loss of connectivity.

**Note**

UplinkFast is most useful in wiring-closet switches at the access or edge of the network. It is not appropriate for backbone devices. This feature might not be useful for other types of applications.

UplinkFast provides fast convergence after a direct link failure and achieves load balancing between redundant Layer 2 links using uplink groups. An uplink group is a set of Layer 2 interfaces (per VLAN), only one of which is forwarding at any given time. Specifically, an uplink group consists of the root port (which is forwarding) and a set of blocked ports, except for self-looping ports. The uplink group provides an alternate path in case the currently forwarding link fails.

**Figure 15-3** shows an example topology with no link failures. Switch A, the root switch, is connected directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that is connected directly to Switch B is in a blocking state.
Understanding Optional Spanning-Tree Features

Figure 15-3  UplinkFast Example Before Direct Link Failure

If Switch C detects a link failure on the currently active link L2 on the root port (a direct link failure), UplinkFast unblocks the blocked port on Switch C and transitions it to the forwarding state without going through the listening and learning states, as shown in Figure 15-4. This change takes approximately 1 to 5 seconds.

Figure 15-4  UplinkFast Example After Direct Link Failure

Understanding Cross-Stack UplinkFast

Cross-stack UplinkFast (CSUF) provides a fast spanning-tree transition (fast convergence in less than 1 second under normal network conditions) across a stack of switches that use the GigaStack GBIC modules connected in a shared cascaded configuration (multidrop backbone). During the fast transition, an alternate redundant link on the stack of switches is placed in the forwarding state without causing temporary spanning-tree loops or loss of connectivity to the backbone. With this feature, you can have a redundant and resilient network in some configurations. You enable CSUF by using the spanning-tree stack-port interface configuration command.

CSUF might not provide a fast transition all the time; in these cases, the normal spanning-tree transition occurs, completing in 30 to 40 seconds. For more information, see the “Events that Cause Fast Convergence” section on page 15-7.
How CSUF Works

CSUF ensures that one link in the stack is elected as the path to the root. As shown in Figure 15-5, Switches A, B, and C are cascaded through the GigaStack GBIC module to form a multidrop backbone, which communicates control and data traffic across the switches at the access layer. The switches in the stack use their stack ports to communicate with each other and to connect to the stack backbone; stack ports are always in the spanning-tree forwarding state. The stack-root port on Switch A provides the path to the root of the spanning tree; the alternate stack-root ports on Switches B and C can provide an alternate path to the spanning-tree root if the current stack-root switch fails or if its link to the spanning-tree root fails.

Link A, the root link, is in the spanning-tree forwarding state; Links B and C are alternate redundant links that are in the spanning-tree blocking state. If Switch A fails, if its stack-root port fails, or if Link A fails, CSUF selects either the Switch B or Switch C alternate stack-root port and puts it into the forwarding state in less than 1 second.

CSUF uses the Stack Membership Discovery Protocol to build a neighbor list of stack members through the receipt of discovery hello packets. When certain link loss or spanning-tree events occur (described in “Events that Cause Fast Convergence” section on page 15-7), the Fast Uplink Transition Protocol uses the neighbor list to send fast-transition requests on the stack port to stack members.
The switch sending the fast-transition request needs to do a fast transition to the forwarding state of a port that it has chosen as the root port, and it must obtain an acknowledgement from each stack switch before performing the fast transition.

Each switch in the stack determines if the sending switch is a better choice than itself to be the stack root of this spanning-tree instance by comparing the root, cost, and bridge ID. If the sending switch is the best choice as the stack root, each switch in the stack returns an acknowledgement; otherwise, it does not respond to the sending switch (drops the packet). The sending switch then has not received acknowledgements from all stack switches.

When acknowledgements are received from all stack switches, the Fast Uplink Transition Protocol on the sending switch immediately transitions its alternate stack-root port to the forwarding state. If acknowledgements from all stack switches are not obtained by the sending switch, the normal spanning-tree transitions (blocking, listening, learning, and forwarding) take place, and the spanning-tree topology converges at its normal rate (2 * forward-delay time + max-age time).

The Fast Uplink Transition Protocol is implemented on a per-VLAN basis and affects only one spanning-tree instance at a time.

**Events that Cause Fast Convergence**

Depending on the network event or failure, the CSUF fast convergence might or might not occur. Fast convergence (less than 1 second under normal network conditions) occurs under these circumstances:

- The stack-root port link fails.
  - If two switches in the stack have alternate paths to the root, only one of the switches performs the fast transition.
- The failed link, which connects the stack root to the spanning-tree root, recovers.
- A network reconfiguration causes a new stack-root switch to be selected.
- A network reconfiguration causes a new port on the current stack-root switch to be chosen as the stack-root port.

*Note* The fast transition might not occur if multiple events occur simultaneously. For example, if a stack member switch is powered off, and at the same time, the link connecting the stack root to the spanning-tree root comes back up, the normal spanning-tree convergence occurs.

Normal spanning-tree convergence (30 to 40 seconds) occurs under these conditions:

- The stack-root switch is powered off, or the software failed.
- The stack-root switch, which was powered off or failed, is powered on.
- A new switch, which might become the stack root, is added to the stack.
- A switch other than the stack root is powered off or failed.
- A link fails between stack ports on the multidrop backbone.
Limitations

These limitations apply to CSUF:

- CSUF uses the GigaStack GBIC module and runs on all Catalyst 3550 switches, all Catalyst 3500 XL switches, Catalyst 2950 switches with GBIC module slots, and only on modular Catalyst 2900 XL switches that have the 1000BASE-X module installed.
- Up to nine stack switches can be connected through their stack ports to the multidrop backbone. Only one stack port per switch is supported.
- Each stack switch can be connected to the spanning-tree backbone through one uplink.
- If the stack consists of a mixture of Catalyst 3550, Catalyst 3500 XL, Catalyst 2950, and Catalyst 2900 XL switches, up to 64 VLANs with spanning tree enabled are supported. If the stack consists of only Catalyst 3550 switches, up to 128 VLANs with spanning tree enabled are supported.

Connecting the Stack Ports

A fast transition occurs across the stack of switches if the multidrop backbone connections are a continuous link from one GigaStack GBIC module to another as shown in the top half of Figure 15-6. The bottom half of Figure 15-6 shows how to connect the GigaStack GBIC module to achieve a normal convergence time.

You should follow these guidelines:

- A switch supports only one stack port.
- Do not connect alternate stack-root ports to stack ports.
- Connect all stack ports on the switch stack to the multidrop backbone.
- You can connect the open ports on the top and bottom GigaStack GBIC modules within the same stack to form a redundant link.
Understanding BackboneFast

BackboneFast detects indirect failures in the core of the backbone. BackboneFast is a complementary technology to the UplinkFast feature, which responds to failures on links directly connected to access switches. BackboneFast optimizes the maximum-age timer, which determines the amount of time the switch stores protocol information received on an interface. When a switch receives an inferior BPDU from the designated port of another switch, the BPDU is a signal that the other switch might have lost its path to the root, and BackboneFast tries to find an alternate path to the root.

BackboneFast, which is enabled by using the `spanning-tree backbonefast` global configuration command, starts when a root port or blocked port on a switch receives inferior BPDU's from its designated switch. An inferior BPDU identifies a switch that declares itself as both the root bridge and the designated switch. When a switch receives an inferior BPDU, it means that a link to which the switch is not directly connected (an indirect link) has failed (that is, the designated bridge has lost its connection...
to the root switch). Under spanning-tree rules, the switch ignores inferior BPDUs for the configured maximum aging time specified by the `spanning-tree vlan vlan-id max-age` global configuration command.

The switch tries to determine if it has an alternate path to the root switch. If the inferior BPDU arrives on a blocked port, the root port and other blocked ports on the switch become alternate paths to the root switch. (Self-looped ports are not considered alternate paths to the root switch.) If the inferior BPDU arrives on the root port, all blocked ports become alternate paths to the root switch. If the inferior BPDU arrives on the root port and there are no blocked ports, the switch assumes that it has lost connectivity to the root switch, causes the maximum aging time on the root port to expire, and becomes the root switch according to normal spanning-tree rules.

If the switch has alternate paths to the root switch, it uses these alternate paths to send a root link query (RLQ) request. The switch sends the RLQ request on all alternate paths to the root switch and waits for an RLQ reply from other switches in the network.

If the switch determines that it still has an alternate path to the root, it expires the maximum aging time on the port that received the inferior BPDU. If all the alternate paths to the root switch indicate that the switch has lost connectivity to the root switch, the switch expires the maximum aging time on the port that received the RLQ reply. If one or more alternate paths can still connect to the root switch, the switch makes all ports on which it received an inferior BPDU its designated ports and moves them from the blocking state (if they were in the blocking state), through the listening and learning states, and into the forwarding state.

Figure 15-7 shows an example topology with no link failures. Switch A, the root switch, connects directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that connects directly to Switch B is in the blocking state.

If link L1 fails as shown in Figure 15-8, Switch C cannot detect this failure because it is not connected directly to link L1. However, because Switch B is directly connected to the root switch over L1, it detects the failure, elects itself the root, and begins sending BPDUs to Switch C, identifying itself as the root. When Switch C receives the inferior BPDUs from Switch B, Switch C assumes that an indirect failure has occurred. At that point, BackboneFast allows the blocked port on Switch C to move immediately to the listening state without waiting for the maximum aging time for the port to expire. BackboneFast then transitions the Layer 2 interface on Switch C to the forwarding state, providing a path from Switch B to Switch A. This switchover takes approximately 30 seconds, twice the Forward Delay time if the default Forward Delay time of 15 seconds is set. Figure 15-8 shows how BackboneFast reconfigures the topology to account for the failure of link L1.
Understanding Optional Spanning-Tree Features

If a new switch is introduced into a shared-medium topology as shown in Figure 15-9, BackboneFast is not activated because the inferior BPDUs did not come from the recognized designated bridge (Switch B). The new switch begins sending inferior BPDUs that indicate it is the root switch. However, the other switches ignore these inferior BPDUs, and the new switch learns that Switch B is the designated bridge to Switch A, the root switch.

### Understanding EtherChannel Guard

You can use EtherChannel guard to detect an EtherChannel misconfiguration between the switch and a connected device. A misconfiguration can occur if the switch interfaces are configured in an EtherChannel, but the interfaces on the other device are not. A misconfiguration can also occur if the channel parameters are not the same at both ends of the EtherChannel. For EtherChannel configuration guidelines, see the “EtherChannel Configuration Guidelines” section on page 30-8.

If the switch detects a misconfiguration on the other device, EtherChannel guard places the switch interfaces in the error-disabled state, and this error message appears:

*PM-4-ERR_DISABLE: Channel-misconfig error detected on [chars], putting [chars] in err-disable state.*
You can enable this feature by using the `spanning-tree etherchannel guard misconfig` global configuration command.

**Understanding Root Guard**

The Layer 2 network of a service provider (SP) can include many connections to switches that are not owned by the SP. In such a topology, the spanning tree can reconfigure itself and select a *customer switch* as the root switch, as shown in Figure 15-10. You can avoid this situation by enabling root guard on SP switch interfaces that connect to switches in your customer’s network. If spanning-tree calculations cause an interface in the customer network to be selected as the root port, root guard then places the interface in the root-inconsistent (blocked) state to prevent the customer’s switch from becoming the root switch or being in the path to the root.

If a switch outside the SP network becomes the root switch, the interface is blocked (root-inconsistent state), and spanning tree selects a new root switch. The customer’s switch does not become the root switch and is not in the path to the root.

If the switch is operating in multiple spanning-tree (MST) mode, root guard forces the port to be a designated port. If a boundary port is blocked in an internal spanning-tree (IST) instance because of root guard, the port also is blocked in all MST instances. A boundary port is a port that connects to a LAN, the designated switch of which is either an IEEE 802.1D switch or a switch with a different MST region configuration.

Root guard enabled on an interface applies to all the VLANs to which the interface belongs. VLANs can be grouped and mapped to an MST instance.

You can enable this feature by using the `spanning-tree guard root` interface configuration command.

---

**Caution**

Misuse of the root-guard feature can cause a loss of connectivity.
Understanding Loop Guard

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is configured on the entire switched network.

You can enable this feature by using the `spanning-tree loopguard default` global configuration command.

When the switch is operating in PVST+ or rapid-PVST+ mode, loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

When the switch is operating in MST mode, BPDUs are not sent on nonboundary ports only if the port is blocked by loop guard in all MST instances. On a boundary port, loop guard blocks the port in all MST instances.

Configuring Optional Spanning-Tree Features

These sections describe how to configure optional spanning-tree features:

- Default Optional Spanning-Tree Configuration, page 15-13
- Optional Spanning-Tree Configuration Guidelines, page 15-14
- Enabling Port Fast, page 15-14 (optional)
- Enabling BPDU Guard, page 15-15 (optional)
- Enabling BPDU Filtering, page 15-16 (optional)
- Enabling UplinkFast for Use with Redundant Links, page 15-17 (optional)
- Enabling Cross-Stack UplinkFast, page 15-18 (optional)
- Enabling BackboneFast, page 15-19 (optional)
- Enabling EtherChannel Guard, page 15-19 (optional)
- Enabling Root Guard, page 15-20 (optional)
- Enabling Loop Guard, page 15-20 (optional)

Default Optional Spanning-Tree Configuration

Table 15-1 shows the default optional spanning-tree configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>

<td>Globally disabled.</td>
</tr>
<tr>
<td>EtherChannel guard</td>
<td>Globally enabled.</td>
</tr>
</tbody>
</table>
Chapter 15      Configuring Optional Spanning-Tree Features

Optional Spanning-Tree Configuration Guidelines

You can configure PortFast, BPDU guard, BPDU filtering, EtherChannel guard, root guard, or loop guard if your switch is running PVST+, rapid PVST+, or MSTP.

You can configure the UplinkFast, the BackboneFast, or the cross-stack UplinkFast feature for rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

### Enabling Port Fast

A port with the Port Fast feature enabled is moved directly to the spanning-tree forwarding state without waiting for the standard forward-time delay.

Use Port Fast only when connecting a single end station to an access or trunk port. Enabling this feature on a port connected to a switch or hub could prevent spanning tree from detecting and disabling loops in your network, which could cause broadcast storms and address-learning problems.

If you enable the voice VLAN feature, the Port Fast feature is automatically enabled. When you disable voice VLAN, the Port Fast feature is not automatically disabled. For more information, see Chapter 18, “Configuring Voice VLAN.”

You can enable this feature if your switch is running PVST+, rapid PVST+, or MSTP.

Beginning in privileged EXEC mode, follow these steps to enable Port Fast. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>

</tbody>
</table>
Chapter 15 Configuring Optional Spanning-Tree Features

Configuring Optional Spanning-Tree Features

Note
You can use the spanning-tree portfast default global configuration command to globally enable the Port Fast feature on all nontrunking ports.

Step 3
spanning-tree portfast [trunk]
Enable Port Fast on an access port connected to a single workstation or server. By specifying the trunk keyword, you can enable Port Fast on a trunk port.

Note
To enable Port Fast on trunk ports, you must use the spanning-tree portfast trunk interface configuration command. The spanning-tree portfast command will not work on trunk ports.

Caution
Make sure that there are no loops in the network between the trunk port and the workstation or server before you enable Port Fast on a trunk port.

By default, Port Fast is disabled on all ports.

Step 4
end
Return to privileged EXEC mode.

Step 5
show spanning-tree interface interface-id portfast
Verify your entries.

Step 6
copy running-config startup-config
(Optional) Save your entries in the configuration file.

Note
You can also use the spanning-tree bpdu-guard enable interface configuration command to enable BPDU guard on any port without also enabling the Port Fast feature. When the port receives a BPDU, it is put in the error-disabled state.

Enabling BPDU Guard

When you globally enable BPDU guard on ports that are Port Fast-enabled (the ports are in a Port Fast-operational state), spanning tree continues to run on the ports. They remain up unless they receive a BPDU.

In a valid configuration, Port Fast-enabled ports do not receive BPDU. Receiving a BPDU on a Port Fast-enabled port signals an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the port in the error-disabled state. The BPDU guard feature provides a secure response to invalid configurations because you must manually put the port back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

Caution
Configure Port Fast only on ports that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.

You can also use the spanning-tree bpdu-guard enable interface configuration command to enable BPDU guard on any port without also enabling the Port Fast feature. When the port receives a BPDU, it is put in the error-disabled state.

You can enable the BPDU guard feature if your switch is running PVST+, rapid PVST+, or MSTP.
Beginning in privileged EXEC mode, follow these steps to globally enable the BPDU guard feature. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree portfast bpduguard default</td>
</tr>
<tr>
<td>Step 3</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 4</td>
<td>spanning-tree portfast</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable BPDU guard, use the `no spanning-tree portfast bpduguard default` global configuration command.

You can override the setting of the `no spanning-tree portfast bpduguard default` global configuration command by using the `spanning-tree bpduguard enable` interface configuration command.

**Enabling BPDU Filtering**

When you globally enable BPDU filtering on Port Fast-enabled ports, it prevents ports that are in a Port Fast-operational state from sending or receiving BPDUs. The ports still send a few BPDUs at link-up before the switch begins to filter outbound BPDUs. You should globally enable BPDU filtering on a switch so that hosts connected to these ports do not receive BPDUs. If a BPU is received on a Port Fast-enabled port, the port loses its Port Fast-operational status, and BPDU filtering is disabled.

**Caution**

Configure Port Fast only on ports that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.

You can also use the `spanning-tree bpdufilter enable` interface configuration command to enable BPDU filtering on any port without also enabling the Port Fast feature. This command prevents the port from sending or receiving BPDUs.

**Caution**

Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

You can enable the BPDU filtering feature if your switch is running PVST+, rapid PVST+, or MSTP. Beginning in privileged EXEC mode, follow these steps to globally enable the BPDU filtering feature. This procedure is optional.
To disable BPDU filtering, use the `no spanning-tree portfast bpdufilter default` global configuration command.

You can override the setting of the `no spanning-tree portfast bpdufilter default` global configuration command by using the `spanning-tree bpdufilter enable` interface configuration command.

## Enabling UplinkFast for Use with Redundant Links

UplinkFast cannot be enabled on VLANs that have been configured for switch priority. To enable UplinkFast on a VLAN with switch priority configured, first restore the switch priority on the VLAN to the default value by using the `no spanning-tree vlan vlan-id priority` global configuration command.

**Note**

When you enable UplinkFast, it affects all VLANs on the switch. You cannot configure UplinkFast on an individual VLAN.

You can enable the UplinkFast feature for rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

Beginning in privileged EXEC mode, follow these steps to enable UplinkFast. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
(Optional) For `pkts-per-second`, the range is 0 to 32000 packets per second; the default is 150.  
If you set the rate to 0, station-learning frames are not generated, and the spanning-tree topology converges more slowly after a loss of connectivity. |
| Step 3end | Return to privileged EXEC mode. |
| Step 4show spanning-tree summary | Verify your entries. |
| Step 5copy running-config startup-config | (Optional) Save your entries in the configuration file. |
When UplinkFast is enabled, the switch priority of all VLANs is set to 49152. If you change the path cost to a value less than 3000 and you enable UplinkFast or UplinkFast is already enabled, the path cost of all interfaces and VLAN trunks is increased by 3000 (if you change the path cost to 3000 or above, the path cost is not altered). The changes to the switch priority and the path cost reduces the chance that the switch will become the root switch.

When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.

To return the update packet rate to the default setting, use the `no spanning-tree uplinkfast max-update-rate` global configuration command. To disable UplinkFast, use the `no spanning-tree uplinkfast` command.

### Enabling Cross-Stack UplinkFast

Before enabling CSUF, make sure your stack switches are properly connected. For more information, see the “Connecting the Stack Ports” section on page 15-8.

You can enable the CSUF feature for rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

Beginning in privileged EXEC mode, follow these steps to enable CSUF. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 spanning-tree uplinkfast [max-update-rate pkts-per-second]</td>
<td>Enable UplinkFast on the switch. (Optional) For max-update-rate pkts-per-second, specify the number of packets per second at which update packets are sent. The range is 0 to 65535; the default is 150 packets per second.</td>
</tr>
<tr>
<td>Step 3 interface interface-id</td>
<td>Specify the GBIC module interface on which to enable CSUF, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 4 spanning-tree stack-port</td>
<td>Enable CSUF on only one stack-port GBIC interface. The stack port connects to the GigaStack GBIC module multidrop backbone. If you try to enable CSUF on a Fast Ethernet or a Gigabit-captible Ethernet port, you receive an error message. If CSUF is already enabled on an interface and you try to enable it on another interface, you receive an error message. You must disable CSUF on the first interface before enabling it on a new interface. Use this command only on access switches.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable CSUF on an interface, use the `no spanning-tree stack-port` interface configuration command. To disable UplinkFast on the switch and all its VLANs, use the `no spanning-tree uplinkfast` global configuration command.
Enabling BackboneFast

You can enable BackboneFast to detect indirect link failures and to start the spanning-tree reconfiguration sooner.

**Note**
If you use BackboneFast, you must enable it on all switches in the network. BackboneFast is not supported on Token Ring VLANs. This feature is supported for use with third-party switches.

You can enable the BackboneFast feature for rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

Beginning in privileged EXEC mode, follow these steps to enable BackboneFast. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 spanning-tree backbonefast</td>
<td>Enable BackboneFast.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show spanning-tree summary</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable the BackboneFast feature, use the `no spanning-tree backbonefast` global configuration command.

Enabling EtherChannel Guard

You can enable EtherChannel guard to detect an EtherChannel misconfiguration if your switch is running PVST+, rapid PVST+, or MSTP.

Beginning in privileged EXEC mode, follow these steps to enable EtherChannel guard. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 spanning-tree etherchannel guard misconfig</td>
<td>Enable EtherChannel guard.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show spanning-tree summary</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable the EtherChannel guard feature, use the `no spanning-tree etherchannel guard misconfig` global configuration command.

You can use the `show interfaces status err-disabled` privileged EXEC command to show which switch ports are disabled because of an EtherChannel misconfiguration. On the remote device, you can enter the `show etherchannel summary` privileged EXEC command to verify the EtherChannel configuration.
After the configuration is corrected, enter the `shutdown` and `no shutdown` interface configuration commands on the port-channel interfaces that were misconfigured.

**Enabling Root Guard**

Root guard enabled on an interface applies to all the VLANs to which the interface belongs.

Do not enable the root guard on interfaces to be used by the UplinkFast feature. With UplinkFast, the backup interfaces (in the blocked state) replace the root port in the case of a failure. However, if root guard is also enabled, all the backup interfaces used by the UplinkFast feature are placed in the root-inconsistent state (blocked) and are prevented from reaching the forwarding state.

**Note**

You cannot enable both root guard and loop guard at the same time.

You can enable this feature if your switch is running PVST+, rapid PVST+, or MSTP.

Beginning in privileged EXEC mode, follow these steps to enable root guard on an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify an interface to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 spanning-tree guard root</td>
<td>Enable root guard on the interface.</td>
</tr>
<tr>
<td></td>
<td>By default, root guard is disabled on all interfaces.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable root guard, use the `no spanning-tree guard` interface configuration command.

**Enabling Loop Guard**

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is configured on the entire switched network. Loop guard operates only on ports that are considered point-to-point by the spanning tree.

**Note**

You cannot enable both loop guard and root guard at the same time.

You can enable this feature if your switch is running PVST+, rapid PVST+, or MSTP.

Beginning in privileged EXEC mode, follow these steps to enable loop guard. This procedure is optional.
To globally disable loop guard, use the `no spanning-tree loopguard default` global configuration command. You can override the setting of the `no spanning-tree loopguard default` global configuration command by using the `spanning-tree guard loop` interface configuration command.

**Displaying the Spanning-Tree Status**

To display the spanning-tree status, use one or more of the privileged EXEC commands in Table 15-2:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show spanning-tree active</code></td>
<td>Displays spanning-tree information on active interfaces only.</td>
</tr>
<tr>
<td><code>show spanning-tree detail</code></td>
<td>Displays a detailed summary of interface information.</td>
</tr>
<tr>
<td><code>show spanning-tree interface interface-id</code></td>
<td>Displays spanning-tree information for the specified interface.</td>
</tr>
<tr>
<td><code>show spanning-tree mst interface interface-id</code></td>
<td>Displays MST information for the specified interface.</td>
</tr>
<tr>
<td><code>show spanning-tree summary [totals]</code></td>
<td>Displays a summary of port states or displays the total lines of the spanning-tree state section.</td>
</tr>
</tbody>
</table>

You can clear spanning-tree counters by using the `clear spanning-tree [interface interface-id]` privileged EXEC command.

For information about other keywords for the `show spanning-tree` privileged EXEC command, see the command reference for this release.
Chapter 15  Configuring Optional Spanning-Tree Features

Displaying the Spanning-Tree Status
Configuring VLANs

This chapter describes how to configure normal-range VLANs on your Catalyst 2950 or Catalyst 2955. It includes information about VLAN modes and the VLAN Membership Policy Server (VMPS).

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

The chapter includes these sections:
- Understanding VLANs, page 16-1
- Configuring Normal-Range VLANs, page 16-4
- Configuring Extended-Range VLANs, page 16-11
- Displaying VLANs, page 16-13
- Configuring VLAN Trunks, page 16-13
- Configuring VMPS, page 16-23

Understanding VLANs

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can group end stations even if they are not physically located on the same LAN segment. Any switch port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router or bridge as shown in Figure 16-1. Because a VLAN is considered a separate logical network, it contains its own MIB information and can support its own implementation of spanning tree. See Chapter 13, “Configuring STP” and Chapter 14, “Configuring MSTP.”

Note
Before you create VLANs, you must decide whether to use VLAN Trunking Protocol (VTP) to maintain global VLAN configuration for your network. For more information on VTP, see Chapter 17, “Configuring VTP.”
Figure 16-1 shows an example of VLANs segmented into logically defined networks.

**Figure 16-1 VLANs as Logically Defined Networks**

VLANs are often associated with IP subnetworks. For example, all the end stations in a particular IP subnet belong to the same VLAN. Interface VLAN membership on the switch is assigned manually on an interface-by-interface basis. When you assign switch interfaces to VLANs by using this method, it is known as interface-based, or static, VLAN membership.

**Supported VLANs**

Catalyst 2950 switches that run the standard software image (SI) support 128 VLANs; Catalyst 2950 and Catalyst 2955 switches that run the enhanced software image (EI) For the list of switches that support each image, see the release notes. VLANs are identified with a number from 1 to 4094. VLAN IDs 1002 through 1005 are reserved for Token Ring and FDDI VLANs. VTP only learns normal-range VLANs, with VLAN IDs 1 to 1005; VLAN IDs greater than 1005 are extended-range VLANs and are not stored in the VLAN database. The switch must be in VTP transparent mode when you create VLAN IDs from 1006 to 4094.

The switch supports per-VLAN spanning-tree plus (PVST+) with a maximum of spanning-tree instances. One spanning-tree instance is allowed per VLAN. See the “Normal-Range VLAN Configuration Guidelines” section on page 16-5 for more information about the number of spanning-tree instances and the number of VLANs. The switch supports IEEE 802.1Q trunking for sending VLAN traffic over Ethernet ports.
VLAN Port Membership Modes

You configure a port to belong to a VLAN by assigning a membership mode that determines the kind of traffic the port carries and the number of VLANs to which it can belong. Table 16-1 lists the membership modes and membership and VTP characteristics.

Table 16-1 Port Membership Modes

<table>
<thead>
<tr>
<th>Membership Mode</th>
<th>VLAN Membership Characteristics</th>
<th>VTP Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static-access</td>
<td>A static-access port can belong to one VLAN and is manually assigned to that VLAN. For more information, see the “Assigning Static-Access Ports to a VLAN” section on page 16-10.</td>
<td>VTP is not required. If you do not want VTP to globally propagate information, set the VTP mode to transparent to disable VTP. To participate in VTP, there must be at least one trunk port on the switch connected to a trunk port of a second switch.</td>
</tr>
<tr>
<td>Dynamic access</td>
<td>A trunk port is a member of all VLANs by default, including extended-range VLANs, but membership can be limited by configuring the allowed-VLAN list. You can also modify the pruning-eligible list to block flooded traffic to VLANs on trunk ports that are included in the list. For information about configuring trunk ports, see the “Configuring an Ethernet Interface as a Trunk Port” section on page 16-16.</td>
<td>VTP is recommended but not required. VTP maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP exchanges VLAN configuration messages with other switches over trunk links.</td>
</tr>
<tr>
<td>Voice VLAN</td>
<td>A voice VLAN port is an access port attached to a Cisco IP Phone, configured to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.</td>
<td>VTP is not required; it has no effect on voice VLAN.</td>
</tr>
</tbody>
</table>

For more detailed definitions of the modes and their functions, see Table 16-4 on page 16-15.

When a port belongs to a VLAN, the switch learns and manages the addresses associated with the port on a per-VLAN basis. For more information, see the “Managing the MAC Address Table” section on page 7-19.
Configuring Normal-Range VLANs

Normal-range VLANs are VLANs with VLAN IDs 1 to 1005. If the switch is in VTP server or transparent mode, you can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)

---

**Note**

When the switch is in VTP transparent mode, you can also create extended-range VLANs (VLANs with IDs from 1006 to 4094), but these VLANs are not saved in the VLAN database. See the “Configuring Extended-Range VLANs” section on page 16-11.

Configurations for VLAN IDs 1 to 1005 are written to the file `vlan.dat` (VLAN database), and you can display them by entering the `show vlan` privileged EXEC command. The `vlan.dat` file is stored in Flash memory.

---

**Caution**

You can cause inconsistency in the VLAN database if you attempt to manually delete the `vlan.dat` file. If you want to modify the VLAN configuration, use the commands described in these sections and in the command reference for this release. To change the VTP configuration, see Chapter 17, “Configuring VTP.”

---

You use the interface configuration mode to define the port membership mode and to add and remove ports from VLANs. The results of these commands are written to the running-configuration file, and you can display the file by entering the `show running-config` privileged EXEC command.

You can set these parameters when you create a new normal-range VLAN or modify an existing VLAN in the VLAN database:

- VLAN ID
- VLAN name
- VLAN type (Ethernet, Fiber Distributed Data Interface [FDDI], FDDI network entity title [NET], TrBRF, or TrCRF, Token Ring, Token Ring-Net)
- VLAN state (active or suspended)
- Maximum transmission unit (MTU) for the VLAN
- Security Association Identifier (SAID)
- Bridge identification number for TrBRF VLANs
- Ring number for FDDI and TrCRF VLANs
- Parent VLAN number for TrCRF VLANs
- Spanning Tree Protocol (STP) type for TrCRF VLANs
- VLAN number to use when translating from one VLAN type to another

---

**Note**

This section does not provide configuration details for most of these parameters. For complete information on the commands and parameters that control VLAN configuration, see the command reference for this release.

This section includes information about these topics about normal-range VLANs:

- Token Ring VLANs, page 16-5
Token Ring VLANs

Although the switch does not support Token Ring connections, a remote device such as a Catalyst 5000 series switch with Token Ring connections could be managed from one of the supported switches. Switches running VTP version 2 advertise information about these Token Ring VLANs:

- Token Ring TrBRF VLANs
- Token Ring TrCRF VLANs

For more information on configuring Token Ring VLANs, see the Catalyst 5000 Series Software Configuration Guide.

Normal-Range VLAN Configuration Guidelines

Follow these guidelines when creating and modifying normal-range VLANs in your network:

- See the “Supported VLANs” section on page 16-2 for the maximum number of supported VLANs per switch model. On a switch supporting 250 VLANs, if VTP reports that there are 250 active VLANs, four of the active VLANs (1002 to 1005) are reserved for Token Ring and FDDI.
- Normal-range VLANs are identified with a number between 1 and 1001. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs.
- VLAN configuration for VLANs 1 to 1005 are always saved in the VLAN database. If VTP mode is transparent, VTP and VLAN configuration are also saved in the switch running configuration file.
- The switch also supports VLAN IDs 1006 through 4094 in VTP transparent mode (VTP disabled). These are extended-range VLANs, and configuration options are limited. Extended-range VLANs are not saved in the VLAN database. See the “Configuring Extended-Range VLANs” section on page 16-11.
- Before you can create a VLAN, the switch must be in VTP server mode or VTP transparent mode. If the switch is a VTP server, you must define a VTP domain, or VTP will not function.
- The switch does not support Token Ring or FDDI media. The switch does not forward FDDI, FDDI-Net, TrCRF, or TrBRF traffic, but it does propagate the VLAN configuration through VTP.
- The switch supports 64 spanning-tree instances. If a switch has more active VLANs than supported spanning-tree instances, spanning tree can be enabled on 64 VLANs and is disabled on the remaining VLANs. If you have already used all available spanning-tree instances on a switch, adding another VLAN anywhere in the VTP domain creates a VLAN on that switch that is not running spanning tree. If you have the default allowed list on the trunk ports of that switch (which is to allow all VLANs), the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that would not be broken, particularly if there...
are several adjacent switches that all have run out of spanning-tree instances. You can prevent this possibility by setting allowed lists on the trunk ports of switches that have used up their allocation of spanning-tree instances.

If the number of VLANs on the switch exceeds the number of supported spanning tree instances, we recommend that you configure the IEEE 802.1S Multiple STP (MSTP) on your switch to map multiple VLANs to a single STP instance. For more information about MSTP, see Chapter 14, “Configuring MSTP.”

**VLAN Configuration Mode Options**

You can configure normal-range VLANs (with VLAN IDs 1 to 1005) by using these two configuration modes:

- VLAN Configuration in config-vlan Mode, page 16-6
  
  You access config-vlan mode by entering the `vlan vlan-id` global configuration command.

- VLAN Configuration in VLAN Configuration Mode, page 16-6
  
  You access VLAN database configuration mode by entering the `vlan database` privileged EXEC command.

**VLAN Configuration in config-vlan Mode**

To access config-vlan mode, enter the `vlan` global configuration command with a VLAN ID. Enter a new VLAN ID to create a VLAN or with an existing VLAN ID to modify the VLAN. You can use the default VLAN configuration (Table 16-2) or enter multiple commands to configure the VLAN. For more information about commands available in this mode, see the `vlan` global configuration command description in the command reference for this release. When you have finished the configuration, you must exit config-vlan mode for the configuration to take effect. To display the VLAN configuration, enter the `show vlan` privileged EXEC command.

You must use this config-vlan mode when creating extended-range VLANs (VLAN IDs greater than 1005). See the “Configuring Extended-Range VLANs” section on page 16-11.

**VLAN Configuration in VLAN Configuration Mode**

To access VLAN configuration mode, enter the `vlan database` privileged EXEC command. Then enter the `vlan` command with a new VLAN ID to create a VLAN or with an existing VLAN ID to modify the VLAN. You can use the default VLAN configuration (Table 16-2) or enter multiple commands to configure the VLAN. For more information about keywords available in this mode, see the `vlan` VLAN configuration command description in the command reference for this release. When you have finished the configuration, you must enter `apply` or `exit` for the configuration to take effect. When you enter the `exit` command, it applies all commands and updates the VLAN database. VTP messages are sent to other switches in the VTP domain, and the privileged EXEC mode prompt appears.

**Saving VLAN Configuration**

The configurations of VLAN IDs 1 to 1005 are always saved in the VLAN database (vlan.dat file). If VTP mode is transparent, they are also saved in the switch running configuration file, and you can enter the `copy running-config startup-config` privileged EXEC command to save the configuration in the
startup configuration file. You can use the `show running-config vlan` privileged EXEC command to display the switch running configuration file. To display the VLAN configuration, enter the `show vlan` privileged EXEC command.

When you save VLAN and VTP information (including extended-range VLAN configuration information) in the startup configuration file and reboot the switch, the switch configuration is determined as follows:

- If the VTP mode is transparent in the startup configuration, and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared). The VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

- If the VTP mode or domain name in the startup configuration does not match the VLAN database, the domain name and VTP mode and configuration for the first 1005 VLAN IDs use the VLAN database information.

- If the VTP mode is server, the domain name and VLAN configuration for the first 1005 VLAN IDs use the VLAN database information.

- If the switch is running Cisco IOS Release 12.1(9)EA1 or later and you use an older startup configuration file to boot up the switch, the configuration file does not contain VTP or VLAN information, and the switch uses the VLAN database configurations.

- If the switch is running a Cisco IOS release earlier than 12.1(9)EA1 and you use a startup configuration file from Cisco IOS Release 12.1(9)EA1 or later to boot up the switch, the image on the switch does not recognize the VLAN and VTP configurations in the startup configuration file, so the switch uses the VLAN database configuration.

Caution

If the VLAN database configuration is used at startup and the startup configuration file contains extended-range VLAN configuration, this information is lost when the system boots up.

**Default Ethernet VLAN Configuration**

Table 16-2 shows the default configuration for Ethernet VLANs.

Note

The switch supports Ethernet interfaces exclusively. Because FDDI and Token Ring VLANs are not locally supported, you only configure FDDI and Token Ring media-specific characteristics for VTP global advertisements to other switches.

**Table 16-2 Ethernet VLAN Defaults and Ranges**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>IEEE 802.10 SAID</td>
<td>100001 (100000 plus the VLAN ID)</td>
<td>1 to 4294967294</td>
</tr>
<tr>
<td>MTU size</td>
<td>1500</td>
<td>1500 to 18190</td>
</tr>
<tr>
<td>Translational bridge 1</td>
<td>0</td>
<td>0–1005</td>
</tr>
<tr>
<td>Translational bridge 2</td>
<td>0</td>
<td>0–1005</td>
</tr>
</tbody>
</table>
Creating or Modifying an Ethernet VLAN

Each Ethernet VLAN in the VLAN database has a unique, 4-digit ID that can be a number from 1 to 1001. VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs. To create a normal-range VLAN to be added to the VLAN database, assign a number and name to the VLAN.

**Note**
When the switch is in VTP transparent mode and the EI is installed, you can assign VLAN IDs greater than 1006, but they are not added to the VLAN database. See the “Configuring Extended-Range VLANs” section on page 16-11.

For the list of default parameters that are assigned when you add a VLAN, see the “Configuring Normal-Range VLANs” section on page 16-4.

Beginning in privileged EXEC mode, follow these steps to use config-vlan mode to create or modify an Ethernet VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 vlan vlan-id</td>
<td>Enter a VLAN ID, and enter config-vlan mode. Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify a VLAN. <strong>Note</strong> The available VLAN ID range for this command is 1 to 4094. For information about adding VLAN IDs greater than 1005 (extended-range VLANs), see the “Configuring Extended-Range VLANs” section on page 16-11.</td>
</tr>
<tr>
<td>Step 3 name vlan-name</td>
<td>(Optional) Enter a name for the VLAN. If no name is entered, the default is to append the vlan-id with leading zeros to the word VLAN. For example, VLAN0004 is a default VLAN name for VLAN 4.</td>
</tr>
<tr>
<td>Step 4 mtu mtu-size</td>
<td>(Optional) Change the MTU size (or other VLAN characteristic).</td>
</tr>
<tr>
<td>Step 5 remote-span</td>
<td>(Optional) Configure the VLAN as the RSPAN VLAN for a remote SPAN session. For more information on remote SPAN, see</td>
</tr>
<tr>
<td>Step 6 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7 show vlan [name vlan-name</td>
<td>id vlan-id] Verify your entries.</td>
</tr>
<tr>
<td>Step 8 copy running-config startup config</td>
<td>(Optional) If the switch is in VTP transparent mode, the VLAN configuration is saved in the running configuration file as well as in the VLAN database. This saves the configuration in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

To return the VLAN name to the default settings, use the `no vlan name`, `no vlan mtu` config-vlan commands.

This example shows how to use config-vlan mode to create Ethernet VLAN 20, name it `test20`, and add it to the VLAN database:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan)# name test20
Switch(config-vlan)# end
```
Beginning in privileged EXEC mode, follow these steps to use VLAN configuration mode to create or modify an Ethernet VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>vlan database</strong></td>
</tr>
<tr>
<td></td>
<td>Enter VLAN database configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>vlan vlan-id name vlan-name</strong></td>
</tr>
<tr>
<td></td>
<td>Add an Ethernet VLAN by assigning a number to it. The range is 1 to 1001; do not enter leading zeros. If no name is entered, the default is to append the vlan-id with leading zeros to the word VLAN. For example, VLAN0004 is a default VLAN name for VLAN 4.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>vlan vlan-id mtu mtu-size</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) To modify a VLAN, identify the VLAN and change a characteristic, such as the MTU size.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td></td>
<td>Update the VLAN database, propagate it throughout the administrative domain, and return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>**show vlan {name vlan-name</td>
</tr>
<tr>
<td></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>copy running-config startup config</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) If the switch is in VTP transparent mode, the VLAN configuration is saved in the running configuration file as well as in the VLAN database. This saves the configuration in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

**Note**

You cannot configure an RSPAN VLAN in VLAN database configuration mode.

To return the VLAN name to the default settings, use the **no vlan vlan-id name** VLAN configuration command.

This example shows how to use VLAN database configuration mode to create Ethernet VLAN 20, name it **test20**, and add it to the VLAN database:

```的命运
Switch# vlan database
Switch(vlan)# vlan 20 name test20
Switch(vlan)# exit
APPLY completed.
Exiting....
Switch#
```

**Deleting a VLAN**

When you delete a VLAN from a switch that is in VTP server mode, the VLAN is removed from the VLAN database for all switches in the VTP domain. When you delete a VLAN from a switch that is in VTP transparent mode, the VLAN is deleted only on that specific switch.

You cannot delete the default VLANs for the different media types: Ethernet VLAN 1 and FDDI or Token Ring VLANs 1002 to 1005.

**Caution**

When you delete a VLAN, any ports assigned to that VLAN become inactive. They remain associated with the VLAN (and thus inactive) until you assign them to a new VLAN.
Beginning in privileged EXEC mode, follow these steps to delete a VLAN on the switch by using global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 no vlan vlan-id</td>
<td>Remove the VLAN by entering the VLAN ID.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show vlan brief</td>
<td>Verify the VLAN removal.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup config</td>
<td>(Optional) If the switch is in VTP transparent mode, the VLAN configuration is saved in the running configuration file as well as in the VLAN database. This saves the configuration in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

To delete a VLAN in VLAN database configuration mode, use the `vlan database` privileged EXEC command to enter VLAN database configuration mode and the `no vlan vlan-id` VLAN configuration command.

### Assigning Static-Access Ports to a VLAN

You can assign a static-access port to a VLAN without having VTP globally propagate VLAN configuration information by disabling VTP (VTP transparent mode).

**Note**

If you assign an interface to a VLAN that does not exist, the new VLAN is created. (See the “Creating or Modifying an Ethernet VLAN” section on page 16-8.)

Beginning in privileged EXEC mode, follow these steps to assign a port to a VLAN in the VLAN database:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter the interface to be added to the VLAN.</td>
</tr>
<tr>
<td>Step 3 switchport mode access</td>
<td>Define the VLAN membership mode for the port (Layer 2 access port).</td>
</tr>
<tr>
<td>Step 4 switchport access vlan vlan-id</td>
<td>Assign the port to a VLAN. Valid VLAN IDs are 1 to 4094.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show running-config interface interface-id</td>
<td>Verify the VLAN membership mode of the interface.</td>
</tr>
<tr>
<td>Step 7 show interfaces interface-id switchport</td>
<td>Verify your entries in the Administrative Mode and the Access Mode VLAN fields of the display.</td>
</tr>
<tr>
<td>Step 8 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return an interface to its default configuration, use the `default interface interface-id` interface configuration command.
This example shows how to configure a port as an access port in VLAN 2:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 2
Switch(config-if)# end
Switch#
```

### Configuring Extended-Range VLANs

When the switch is in VTP transparent mode (VTP disabled), you can create extended-range VLANs (in the range 1006 to 4094 for any switch port commands that allow VLAN IDs). Enter the `vlan vlan-id` global configuration command to access config-vlan mode and to configure extended-range VLANs. The VLAN database configuration mode (that you access by entering the `vlan database` privileged EXEC command) does not support the extended range.

Extended-range VLAN configurations are not stored in the VLAN database. Because VTP mode is transparent, they are stored in the switch running configuration file. You can save the configuration in the startup configuration file by using the `copy running-config startup-config` privileged EXEC command.

---

**Note**

Although the switch supports 4094 VLAN IDs, see the “Supported VLANs” section on page 16-2 for the actual number of VLANs supported.

This section includes this information about extended-range VLANs:

- Default VLAN Configuration, page 16-11
- Extended-Range VLAN Configuration Guidelines, page 16-11
- Creating an Extended-Range VLAN, page 16-12
- Displaying VLANs, page 16-13

### Default VLAN Configuration

See Table 16-2 on page 16-7 for the default configuration for Ethernet VLANs. You can change only the MTU size on extended-range VLANs; all other characteristics must remain at the default state.

### Extended-Range VLAN Configuration Guidelines

Follow these guidelines when creating extended-range VLANs:

- To add an extended-range VLAN, you must use the `vlan vlan-id` global configuration command and access config-vlan mode. You cannot add extended-range VLANs in VLAN database configuration mode (accessed by entering the `vlan database` privileged EXEC command).
- VLAN IDs in the extended range are not saved in the VLAN database and are not recognized by VTP.
- You cannot include extended-range VLANs in the pruning eligible range.
The switch must be in VTP transparent mode when you create extended-range VLANs. If VTP mode is server or client, an error message is generated, and the extended-range VLAN is rejected.

You can set the VTP mode to transparent in global configuration mode or in VLAN database configuration mode. See the “Disabling VTP (VTP Transparent Mode)” section on page 17-12. You should save this configuration to the startup configuration so that the switch will boot up in VTP transparent mode. Otherwise, you will lose extended-range VLAN configuration if the switch resets.

VLANs in the extended range are not supported by VQP. They cannot be configured by VMPS.

STP is enabled by default on extended-range VLANs, but you can disable it by using the `no spanning-tree vlan vlan-id` global configuration command. When the maximum number of spanning-tree instances (64) are on the switch, spanning tree is disabled on any newly created VLANs. If the number of VLANs on the switch exceeds the maximum number of spanning tree instances, we recommend that you configure the IEEE 802.1S Multiple STP (MSTP) on your switch to map multiple VLANs to a single STP instance. For more information about MSTP, see Chapter 14, “Configuring MSTP.”

### Creating an Extended-Range VLAN

You create an extended-range VLAN in global configuration mode by entering the `vlan` global configuration command with a VLAN ID from 1006 to 4094. This command accesses the config-vlan mode. The extended-range VLAN has the default Ethernet VLAN characteristics (see Table 16-2), and the MTU size is the only parameter you can change. See the description of the `vlan` global configuration command in the command reference for defaults of all parameters. If you enter an extended-range VLAN ID when the switch is not in VTP transparent mode, an error message is generated when you exit from config-vlan mode, and the extended-range VLAN is not created.

Extended-range VLANs are not saved in the VLAN database; they are saved in the switch running configuration file. You can save the extended-range VLAN configuration in the switch startup configuration file by using the `copy running-config startup-config` privileged EXEC command.

Beginning in privileged EXEC mode, follow these steps to create an extended-range VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>vtp mode transparent</code> Configure the switch for VTP transparent mode, disabling VTP.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>vlan vlan-id</code> Enter an extended-range VLAN ID and enter config-vlan mode. The range is 1006 to 4094.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>mtu mtu-size</code> (Optional) Modify the VLAN by changing the MTU size. <strong>Note</strong> Although all commands appear in the CLI help in config-vlan mode, only the <code>mtu mtu-size</code> command is supported for extended-range VLANs.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>show vlan id vlan-id</code> Verify that the VLAN has been created.</td>
</tr>
<tr>
<td>Step 7</td>
<td><code>copy running-config startup-config</code> Save your entries in the switch startup configuration file. To save extended-range VLAN configurations, you need to save the VTP transparent mode configuration and the extended-range VLAN configuration in the switch startup configuration file. Otherwise, if the switch resets, it will default to VTP server mode, and the extended-range VLAN IDs will not be saved.</td>
</tr>
</tbody>
</table>
To delete an extended-range VLAN, use the `no vlan vlan-id` global configuration command.

The procedure for assigning static-access ports to an extended-range VLAN is the same as for normal-range VLANs. See the “Assigning Static-Access Ports to a VLAN” section on page 16-10.

This example shows how to create a new extended-range VLAN (when the EI is installed) with all default characteristics, enter config-vlan mode, and save the new VLAN in the switch startup configuration file:

```
Switch(config)# vtp mode transparent
Switch(config)# vlan 2000
Switch(config-vlan)# end
Switch# copy running-config startup config
```

### Displaying VLANs

Use the `show vlan` privileged EXEC command to display a list of all VLANs on the switch, including extended-range VLANs. The display includes VLAN status, ports, and configuration information. To view normal-range VLANs in the VLAN database (1 to 1005) use the `show VLAN configuration` command (accessed by entering the `vlan database` privileged EXEC command). For a list of the VLAN IDs on the switch, use the `show running-config vlan` privileged EXEC command, optionally entering a VLAN ID range.

Table 16-3 lists the commands for monitoring VLANs.

<table>
<thead>
<tr>
<th>Command</th>
<th>Command Mode</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show</td>
<td>VLAN configuration</td>
<td>Display status of VLANs in the VLAN database.</td>
</tr>
<tr>
<td>show current [vlan-id]</td>
<td>VLAN configuration</td>
<td>Display status of all or the specified VLAN in the VLAN database.</td>
</tr>
<tr>
<td>show interfaces [vlan vlan-id]</td>
<td>Privileged EXEC</td>
<td>Display characteristics for all interfaces or for the specified VLAN configured on the switch.</td>
</tr>
<tr>
<td>show running-config vlan</td>
<td>Privileged EXEC</td>
<td>Display all or a range of VLANs on the switch.</td>
</tr>
<tr>
<td>show vlan [id vlan-id]</td>
<td>Privileged EXEC</td>
<td>Display parameters for all VLANs or the specified VLAN on the switch.</td>
</tr>
</tbody>
</table>

For more details about the show command options and explanations of output fields, see the command reference for this release.

### Configuring VLAN Trunks

These sections describe how VLAN trunks function on the switch:

- Trunking Overview, page 16-14
- IEEE 802.1Q Configuration Considerations, page 16-15
- Default Layer 2 Ethernet Interface VLAN Configuration, page 16-16
Trunking Overview

A trunk is a point-to-point link between one or more Ethernet switch interfaces and another networking device such as a router or a switch. Gigabit Ethernet trunks carry the traffic of multiple VLANs over a single link, and you can extend the VLANs across an entire network.

The switch supports IEEE 802.1Q, the industry-standard trunking encapsulation. Figure 16-2 shows a network of switches that are connected by IEEE 802.1Q trunks.

You can configure a trunk on a single Ethernet interface or on an EtherChannel bundle. For more information about EtherChannel, see Chapter 30, “Configuring EtherChannels.”

Ethernet trunk interfaces support different trunking modes (see Table 16-4). You can set an interface as trunking or nontrunking or to negotiate trunking with the neighboring interface. To autonegotiate trunking, the interfaces must be in the same VTP domain.

Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a Point-to-Point Protocol. However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations.

To avoid this, you should configure interfaces connected to devices that do not support DTP to not forward DTP frames, that is, to turn off DTP.

- If you do not intend to trunk across those links, use the `switchport mode access` interface configuration command to disable trunking.
- To enable trunking to a device that does not support DTP, use the `switchport mode trunk` and `switchport nonegotiate` interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.
- With GigaStack GBICs, dynamic trunking is only supported when two switches are connected by a single GigaStack GBIC link. If trunking is required when more than two switches in a stack are connected by GigaStack GBIC links, you must manually configure trunking in this manner:
Manually shut down the GigaStack port by using the `shutdown` interface configuration command.

Manually configure trunk mode on the GigaStack port by using the `switchport mode trunk` interface configuration command on both GBIC interfaces to cause the interfaces to become trunks.

Use the `no shutdown` interface configuration command to bring up the GigaStack port.

**IEEE 802.1Q Configuration Considerations**

IEEE 802.1Q trunks impose these limitations on a network:

- In a network of Cisco switches connected through IEEE 802.1Q trunks, the switches maintain one instance of spanning tree for each VLAN allowed on the trunks. Non-Cisco devices might support one spanning-tree instance for all VLANs.

When you connect a Cisco switch to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco switch combines the spanning-tree instance of the VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q switch. However, spanning-tree information for each VLAN is maintained by Cisco switches separated by a cloud of non-Cisco IEEE 802.1Q switches. The non-Cisco IEEE 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.

- Make sure the native VLAN for an IEEE 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.

- Disabling spanning tree on the native VLAN of an IEEE 802.1Q trunk without disabling spanning tree on every VLAN in the network can potentially cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an IEEE 802.1Q trunk or disable spanning tree on every VLAN in the network. Make sure your network is loop-free before disabling spanning tree.

### Table 16-4 Layer 2 Interface Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>switchport mode access</td>
<td>Puts the interface (access port) into permanent nontrunking mode. The interface becomes a nontrunk interface even if the neighboring interface is a trunk interface.</td>
</tr>
<tr>
<td>switchport mode dynamic desirable</td>
<td>Makes the interface actively attempt to convert the link to a trunk link. The interface becomes a trunk interface if the neighboring interface is set to trunk, desirable, or auto mode. The default switch-port mode for all Ethernet interfaces is dynamic desirable.</td>
</tr>
<tr>
<td>switchport mode dynamic auto</td>
<td>Makes the interface able to convert the link to a trunk link. The interface becomes a trunk interface if the neighboring interface is set to trunk or desirable mode.</td>
</tr>
<tr>
<td>switchport mode trunk</td>
<td>Puts the interface into permanent trunking mode and negotiates to convert the link into a trunk link. The interface becomes a trunk interface even if the neighboring interface is not a trunk interface.</td>
</tr>
<tr>
<td>switchport nonegotiate</td>
<td>Prevents the interface from generating DTP frames. You can use this command only when the interface switchport mode is access or trunk. You must manually configure the neighboring interface as a trunk interface to establish a trunk link.</td>
</tr>
</tbody>
</table>
Default Layer 2 Ethernet Interface VLAN Configuration

Table 16-5 shows the default Layer 2 Ethernet interface VLAN configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface mode</td>
<td></td>
</tr>
<tr>
<td>Allowed VLAN range</td>
<td>VLANs 1 to 4094.</td>
</tr>
<tr>
<td>VLAN range eligible for pruning</td>
<td>VLANs 2 to 1001</td>
</tr>
<tr>
<td>Default VLAN</td>
<td>VLAN 1</td>
</tr>
<tr>
<td>Native VLAN (for IEEE 802.1Q trunks)</td>
<td>VLAN 1</td>
</tr>
</tbody>
</table>

Configuring an Ethernet Interface as a Trunk Port

Because trunk ports send and receive VTP advertisements, to use VTP you must ensure that at least one trunk port is configured on the switch and is connected to the trunk port of a second switch. Otherwise, the switch cannot receive any VTP advertisements.

This section includes these procedures for configuring an Ethernet interface as a trunk port on the switch:

- Interaction with Other Features, page 16-16
- Defining the Allowed VLANs on a Trunk, page 16-18
- Changing the Pruning-Eligible List, page 16-19
- Configuring the Native VLAN for Untagged Traffic, page 16-19

Note

The default mode for interfaces is `switchport mode dynamic desirable` interface configuration mode. If the neighboring interface supports trunking and is configured to allow trunking, the link is a Layer 2 trunk.

Interaction with Other Features

Trunking interacts with other features in these ways:

- Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the switch propagates that setting to all ports in the group:
  - allowed-VLAN list
  - STP port priority for each VLAN
  - STP Port Fast setting
  - trunk status (If one port in a port group ceases to be a trunk, all ports cease to be trunks.)
- If you try to enable IEEE 802.1X on a trunk port, an error message appears, and IEEE 802.1X is not enabled. If you try to change the mode of an IEEE 802.1X-enabled port to trunk, the port mode is not changed.
- A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1X on a dynamic port, an error message appears, and IEEE 802.1X is not enabled. If you try to change the mode of an IEEE 802.1X-enabled port to dynamic, the port mode is not changed.
- Protected ports are supported on IEEE 802.1Q trunks.

### Configuring a Trunk Port

Beginning in privileged EXEC mode, follow these steps to configure a port as an IEEE 802.1Q trunk port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>switchport mode {dynamic {auto</td>
</tr>
<tr>
<td></td>
<td>- dynamic auto—Set the interface to a trunk link if the neighboring interface is set to trunk or desirable mode.</td>
</tr>
<tr>
<td></td>
<td>- dynamic desirable—Set the interface to a trunk link if the neighboring interface is set to trunk, desirable, or auto mode.</td>
</tr>
<tr>
<td></td>
<td>- trunk—Set the interface in permanent trunking mode and negotiate to convert the link to a trunk link even if the neighboring interface is not a trunk interface.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>switchport access vlan vlan-id</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>switchport trunk native vlan vlan-id</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>show interfaces interface-id switchport</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>show interfaces interface-id trunk</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return an interface to its default configuration, use the **default interface interface-id** interface configuration command. To reset all trunking characteristics of a trunking interface to the defaults, use the **no switchport trunk** interface configuration command. To disable trunking, use the **switchport mode access** interface configuration command to configure the port as a static-access port.

This example shows how to configure a port as an IEEE 802.1Q trunk. The example assumes that the neighbor interface is configured to support IEEE 802.1Q trunking.

```xml
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface
Switch(config-if)# switchport mode dynamic desirable
Switch(config-if)# end
```
Defining the Allowed VLANS on a Trunk

By default, a trunk port sends traffic to and receives traffic from all VLANs. All VLAN IDs are allowed on each trunk. However, you can remove VLANs from the allowed list, preventing traffic from those VLANs from passing over the trunk. To restrict the traffic a trunk carries, use the `switchport trunk allowed vlan remove vlan-list` interface configuration command to remove specific VLANs from the allowed list.

To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. This is known as VLAN 1 minimization. VLAN 1 minimization disables VLAN 1 (the default VLAN on all Cisco switch trunk ports) on an individual VLAN trunk link. As a result, no user traffic, including spanning-tree advertisements, is sent or received on VLAN 1.

When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), Dynamic Trunking Protocol (DTP), and VLAN Trunking Protocol (VTP) in VLAN 1.

If a trunk port with VLAN 1 disabled is converted to a nontrunk port, it is added to the access VLAN. If the access VLAN is set to 1, the port is added to VLAN 1, regardless of the `switchport trunk allowed` setting. The same is true for any VLAN that has been disabled on the port.

A trunk port can become a member of a VLAN if the VLAN is enabled, if VTP knows of the VLAN, and if the VLAN is in the allowed list for the port. When VTP detects a newly enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of the enabled VLAN. When VTP detects a new VLAN and the VLAN is not in the allowed list for a trunk port, the trunk port does not become a member of the new VLAN.

Beginning in privileged EXEC mode, follow these steps to modify the allowed list of an IEEE 802.1Q trunk:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>switchport mode trunk</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>switchport trunk allowed vlan {add</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show interfaces interface-id switchport</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default allowed VLAN list of all VLANs, use the `no switchport trunk allowed vlan` interface configuration command.
Chapter 16  Configuring VLANs

Configuring VLAN Trunks

This example shows how to remove VLAN 2 from the allowed VLAN list:

Switch(config)# interface
Switch(config-if)# switchport trunk allowed vlan remove 2
Switch(config-if)# end
Switch#

Changing the Pruning-Eligible List

The pruning-eligible list applies only to trunk ports. Each trunk port has its own eligibility list. VTP pruning must be enabled for this procedure to take effect. The “Enabling VTP Pruning” section on page 17-14 describes how to enable VTP pruning.

Beginning in privileged EXEC mode, follow these steps to remove VLANs from the pruning-eligible list on a trunk port:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>interface interface-id</td>
<td>Enter interface configuration mode, and select the trunk port for which VLANs should be pruned.</td>
</tr>
<tr>
<td></td>
<td>switchport trunk pruning vlan [add</td>
<td>except</td>
</tr>
</tbody>
</table>

| Step 4 | end                      | Return to privileged EXEC mode.             |
|        | show interfaces interface-id switchport | Verify your entries in the Pruning VLANs Enabled field of the display. |
|        | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To return to the default pruning-eligible list of all VLANs, use the no switchport trunk pruning vlan interface configuration command.

Configuring the Native VLAN for Untagged Traffic

A trunk port configured with IEEE 802.1Q tagging can receive both tagged and untagged traffic. By default, the switch forwards untagged traffic in the native VLAN configured for the port. The native VLAN is VLAN 1 by default.

Note

The native VLAN can be assigned any VLAN ID.

For information about IEEE 802.1Q configuration issues, see the “IEEE 802.1Q Configuration Considerations” section on page 16-15.
Beginning in privileged EXEC mode, follow these steps to configure the native VLAN on an IEEE 802.1Q trunk:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>switchport trunk native vlan vlan-id</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show interfaces interface-id switchport</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default native VLAN, VLAN 1, use the no switchport trunk native vlan interface configuration command.

If a packet has a VLAN ID that is the same as the outgoing port native VLAN ID, the packet is sent untagged; otherwise, the switch sends the packet with a tag.

**Load Sharing Using STP**

Load sharing divides the bandwidth supplied by parallel trunks connecting switches. To avoid loops, STP normally blocks all but one parallel link between switches. Using load sharing, you divide the traffic between the links according to which VLAN the traffic belongs.

You configure load sharing on trunk ports by using STP port priorities or STP path costs. For load sharing using STP port priorities, both load-sharing links must be connected to the same switch. For load sharing using STP path costs, each load-sharing link can be connected to the same switch or to two different switches. For more information about STP, see Chapter 13, “Configuring STP.”

**Load Sharing Using STP Port Priorities**

When two ports on the same switch form a loop, the STP port priority setting determines which port is enabled and which port is in a blocking state. You can set the priorities on a parallel trunk port so that the port carries all the traffic for a given VLAN. The trunk port with the higher priority (lower values) for a VLAN is forwarding traffic for that VLAN. The trunk port with the lower priority (higher values) for the same VLAN remains in a blocking state for that VLAN. One trunk port sends or receives all traffic for the VLAN.

Figure 16-3 shows two trunks connecting supported switches. In this example, the switches are configured as follows:

- VLANs 8 through 10 are assigned a port priority of 16 on Trunk 1.
- VLANs 3 through 6 retain the default port priority of 128 on Trunk 1.
- VLANs 3 through 6 are assigned a port priority of 16 on Trunk 2.
- VLANs 8 through 10 retain the default port priority of 128 on Trunk 2.
In this way, Trunk 1 carries traffic for VLANs 8 through 10, and Trunk 2 carries traffic for VLANs 3 through 6. If the active trunk fails, the trunk with the lower priority takes over and carries the traffic for all of the VLANs. No duplication of traffic occurs over any trunk port.

**Figure 16-3  Load Sharing by Using STP Port Priorities**

Beginning in privileged EXEC mode, follow these steps to configure the network shown in **Figure 16-3**.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode on Switch 1.</td>
</tr>
<tr>
<td>Step 2 vtp domain domain-name</td>
<td>Configure a VTP administrative domain.</td>
</tr>
<tr>
<td></td>
<td>The domain name can be from 1 to 32 characters.</td>
</tr>
<tr>
<td>Step 3 vtp mode server</td>
<td>Configure Switch 1 as the VTP server.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show vtp status</td>
<td>Verify the VTP configuration on both Switch A and Switch B.</td>
</tr>
<tr>
<td></td>
<td>In the display, check the <em>VTP Operating Mode</em> and the <em>VTP Domain Name</em> fields.</td>
</tr>
<tr>
<td>Step 6 show vlan</td>
<td>Verify that the VLANs exist in the database on Switch A.</td>
</tr>
<tr>
<td>Step 7 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 8 interface</td>
<td>Enter interface configuration mode, and define as the interface to be configured as a trunk.</td>
</tr>
<tr>
<td>Step 9 switchport mode trunk</td>
<td>Configure the port as a trunk port.</td>
</tr>
<tr>
<td>Step 10 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 11 show interfaces switchport</td>
<td>Verify the VLAN configuration.</td>
</tr>
<tr>
<td>Step 12</td>
<td>Repeat Steps 7 through 11 on Switch A for .</td>
</tr>
<tr>
<td>Step 13</td>
<td>Repeat Steps 7 through 11 on Switch B to configure the trunk ports on</td>
</tr>
<tr>
<td>Step 14 show vlan</td>
<td>When the trunk links come up, VTP passes the VTP and VLAN information to Switch B. Verify that Switch B has learned the VLAN configuration.</td>
</tr>
<tr>
<td>Step 15 configure terminal</td>
<td>Enter global configuration mode on Switch A.</td>
</tr>
<tr>
<td>Step 16 interface</td>
<td>Enter interface configuration mode, and define the interface to set the STP port priority.</td>
</tr>
<tr>
<td>Step 17 spanning-tree vlan 8-10 port-priority 16</td>
<td>Assign the port priority of 16 for VLANs 8 through 10.</td>
</tr>
</tbody>
</table>
Configuring VLAN Trunks

### Load Sharing Using STP Path Cost

You can configure parallel trunks to share VLAN traffic by setting different path costs on a trunk and associating the path costs with different sets of VLANs. The VLANs keep the traffic separate. Because no loops exist, STP does not disable the ports, and redundancy is maintained in the event of a lost link.

In Figure 16-4, Trunk ports 1 and 2 are 100BASE-T ports. The path costs for the VLANs are assigned as follows:

- **VLANs 2 through 4** are assigned a path cost of 30 on Trunk port 1.
- **VLANs 8 through 10** retain the default 100BASE-T path cost on Trunk port 1 of 19.
- **VLANs 8 through 10** are assigned a path cost of 30 on Trunk port 2.
- **VLANs 2 through 4** retain the default 100BASE-T path cost on Trunk port 2 of 19.

![Figure 16-4 Load-Sharing Trunks with Traffic Distributed by Path Cost](image)

Beginning in privileged EXEC mode, follow these steps to configure the network shown in Figure 16-4:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 18</td>
<td>spanning-tree vlan 10 port-priority 16</td>
</tr>
<tr>
<td>Step 19</td>
<td>exit</td>
</tr>
<tr>
<td>Step 20</td>
<td>interface</td>
</tr>
<tr>
<td>Step 21</td>
<td>spanning-tree vlan 3-6 port-priority 16</td>
</tr>
<tr>
<td>Step 22</td>
<td>end</td>
</tr>
<tr>
<td>Step 23</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 24</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface</td>
</tr>
<tr>
<td>Step 3</td>
<td>switchport mode trunk</td>
</tr>
<tr>
<td>Step 4</td>
<td>exit</td>
</tr>
</tbody>
</table>
Configuring VMPS

The switch cannot be a VMPS server but can act as a client to the VMPS and communicate with it through the VLAN Query Protocol (VQP). VMPS dynamically assigns dynamic access port VLAN membership.

This section includes this information about configuring VMPS:

- “Understanding VMPS” section on page 16-23
- “Default VMPS Client Configuration” section on page 16-25
- “VMPS Configuration Guidelines” section on page 16-25
- “Configuring the VMPS Client” section on page 16-26
- “Monitoring the VMPS” section on page 16-28
- “Troubleshooting Dynamic Port VLAN Membership” section on page 16-29
- “VMPS Configuration Example” section on page 16-29

Understanding VMPS

When the VMPS receives a VQP request from a client switch, it searches its database for a MAC-address-to-VLAN mapping. The server response is based on this mapping and whether or not the server is in secure mode. Secure mode determines whether the server shuts down the port when a VLAN is not allowed on it or just denies the port access to the VLAN.
In response to a request, the VMPS takes one of these actions:

- If the assigned VLAN is restricted to a group of ports, the VMPS verifies the requesting port against this group and responds as follows:
  - If the VLAN is allowed on the port, the VMPS sends the VLAN name to the client in response.
  - If the VLAN is not allowed on the port and the VMPS is not in secure mode, the VMPS sends an access-denied response.
  - If the VLAN is not allowed on the port and the VMPS is in secure mode, the VMPS sends a port-shutdown response.

- If the VLAN in the database does not match the current VLAN on the port and active hosts exist on the port, the VMPS sends an access-denied or a port-shutdown response, depending on the secure mode of the VMPS.

If the switch receives an access-denied response from the VMPS, it continues to block traffic from the MAC address to or from the port. The switch continues to monitor the packets directed to the port and sends a query to the VMPS when it identifies a new address. If the switch receives a port-shutdown response from the VMPS, it disables the port. The port must be manually re-enabled by using the device manager, CLI, or SNMP.

You can also use an explicit entry in the configuration table to deny access to specific MAC addresses for security reasons. If you enter the none keyword for the VLAN name, the VMPS sends an access-denied or port-shutdown response, depending on the VMPS secure mode setting.

### Dynamic Port VLAN Membership

A dynamic (nontrunking) port on the switch can belong to only one VLAN, with a VLAN ID from 1 to 1005. When the link comes up, the switch does not forward traffic to or from this port until the VMPS provides the VLAN assignment. The VMPS receives the source MAC address from the first packet of a new host connected to the dynamic port and attempts to match the MAC address to a VLAN in the VMPS database.

If there is a match, the VMPS sends the VLAN number for that port. If the client switch was not previously configured, it uses the domain name from the first VTP packet it receives on its trunk port from the VMPS. If the client switch was previously configured, it includes its domain name in the query packet to the VMPS to obtain its VLAN number. The VMPS verifies that the domain name in the packet matches its own domain name before accepting the request and responds to the client with the assigned VLAN number for the client. If there is no match, the VMPS either denies the request or shuts down the port (depending on the VMPS secure mode setting).

Multiple hosts (MAC addresses) can be active on a dynamic port if they are all in the same VLAN; however, the VMPS shuts down a dynamic port if more than 20 hosts are active on the port.

If the link goes down on a dynamic port, the port returns to an isolated state and does not belong to a VLAN. Any hosts that come online through the port are checked again through the VQP with the VMPS before the port is assigned to a VLAN.

### VMPS Database Configuration File

The VMPS contains a database configuration file that you create. This ASCII text file is stored on a switch-accessible TFTP server that functions as a server for VMPS. The file contains VMPS information, such as the domain name, the fallback VLAN name, and the MAC-address-to-VLAN mapping. The switch cannot act as the VMPS, but you can use a Catalyst 5000 or Catalyst 6000 series switch as the VMPS.
You can configure a fallback VLAN name. If you connect a device with a MAC address that is not in the database, the VMPS sends the fallback VLAN name to the client. If you do not configure a fallback VLAN and the MAC address does not exist in the database, the VMPS sends an *access-denied* response. If the VMPS is in secure mode, it sends a *port-shutdown* response.

Whenever port names are used in the VMPS database configuration file, the server must use the switch convention for naming ports. For example, Fa0/4Gi0/17 is fixed Fast Ethernet port number 4Gigabit Ethernet port number 17. If the switch is a cluster member, the command switch adds the name of the switch before the type. For example, *es3%Fa0/4es3%Gi0/17* refers to fixed Fast Ethernet port number 4Gigabit Ethernet port number 17 on member switch 3. When port names are required, these naming conventions must be followed in the VMPS database configuration file when it is configured to support a cluster.

### Default VMPS Client Configuration

Table 16-6 shows the default VMPS and dynamic port configuration on client switches.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMPS domain server</td>
<td>None</td>
</tr>
<tr>
<td>VMPS reconfirm interval</td>
<td>60 minutes</td>
</tr>
<tr>
<td>VMPS server retry count</td>
<td>3</td>
</tr>
<tr>
<td>Dynamic ports</td>
<td>None configured</td>
</tr>
</tbody>
</table>

### VMPS Configuration Guidelines

These guidelines and restrictions apply to dynamic access port VLAN membership:

- You should configure the VMPS before you configure ports as dynamic.
- When you configure a port as a dynamic access port, the spanning-tree Port Fast feature is automatically enabled for that port. The Port Fast mode accelerates the process of bringing the port into the forwarding state.
- IEEE 802.1X ports cannot be configured as dynamic access ports. If you try to enable IEEE 802.1X on a dynamic-access (VQP) port, an error message appears, and IEEE 802.1X is not enabled. If you try to change an IEEE 802.1X-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.
- Trunk ports cannot be dynamic access ports, but you can enter the `switchport access vlan dynamic` interface configuration command for a trunk port. In this case, the switch retains the setting and applies it if the port is later configured as an access port.
  
  You must turn off trunking on the port before the dynamic access setting takes effect.
- Dynamic access ports cannot be monitor ports.
- Secure ports cannot be dynamic access ports. You must disable port security on a port before it becomes dynamic.
- Dynamic access ports cannot be members of an EtherChannel group.
• Port channels cannot be configured as dynamic access ports.
• The VTP management domain of the VMPS client and the VMPS server must be the same.
• VQP does not support extended-range VLANs (VLAN IDs higher than 1006). Extended-range VLANs cannot be configured by VMPS.
• The VLAN configured on the VMPS server should not be a voice VLAN.

Configuring the VMPS Client

You configure dynamic VLANs by using the VMPS (server). The switch can be a VMPS client; it cannot be a VMPS server.

Entering the IP Address of the VMPS

You must first enter the IP address of the server to configure the switch as a client.

Note
If the VMPS is being defined for a cluster of switches, enter the address on the command switch.

Beginning in privileged EXEC mode, follow these steps to enter the IP address of the VMPS:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>vmps server ipaddress primary</td>
</tr>
<tr>
<td></td>
<td>Enter the IP address of the switch acting as the primary VMPS server.</td>
</tr>
<tr>
<td>Step 3</td>
<td>vmps server ipaddress</td>
</tr>
<tr>
<td></td>
<td>Enter the IP address of the switch acting as a secondary VMPS server. You can enter up to three secondary server addresses.</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>show vmps</td>
</tr>
<tr>
<td></td>
<td>Verify your entries in the VMPS Domain Server field of the display.</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Note
The switch port that is connected to the VMPS server cannot be a dynamic access port. It can be either a static access port or a trunk port. See the “Configuring an Ethernet Interface as a Trunk Port” section on page 16-16.

Configuring Dynamic Access Ports on VMPS Clients

If you are configuring a port on a cluster member switch as a dynamic port, first use the rcommand privileged EXEC command to log into the member switch.

Caution
Dynamic port VLAN membership is for end stations or hubs connected to end stations. Connecting dynamic access ports to other switches can cause a loss of connectivity.
Beginning in privileged EXEC mode, follow these steps to configure a dynamic access port on a VMPS client switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Enter interface configuration mode and the switch port that is connected to the end station.</td>
</tr>
<tr>
<td>Step 3</td>
<td></td>
</tr>
<tr>
<td>switchport mode access</td>
<td>Set the port to access mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td></td>
</tr>
<tr>
<td>switchport access vlan dynamic</td>
<td>Configure the port as eligible for dynamic VLAN membership.</td>
</tr>
<tr>
<td></td>
<td>The dynamic access port must be connected to an end station.</td>
</tr>
<tr>
<td>Step 5</td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td></td>
</tr>
<tr>
<td>show interfaces interface-id switchport</td>
<td>Verify your entries in the Operational Mode field of the display.</td>
</tr>
<tr>
<td>Step 7</td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return an interface to its default configuration, use the default interface interface-id interface configuration command. To return an interface to its default switchport mode (dynamic desirable), use the no switchport mode interface configuration command. To reset the access mode to the default VLAN for the switch, use the no switchport access interface configuration command.

**Note** When you configure a dynamic access port by using the switchport access vlan dynamic interface configuration command, the port might allow unauthorized users to access network resources if the interface changes from access mode to trunk mode through the DTP negotiation. The workaround is to configure the port as a static access port.

Reconfirming VLAN Memberships

Beginning in privileged EXEC mode, follow these steps to confirm the dynamic port VLAN membership assignments that the switch has received from the VMPS:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>vmps reconfirm</td>
<td>Reconfirm dynamic port VLAN membership.</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>show vmps</td>
<td>Verify the dynamic VLAN reconfirmation status.</td>
</tr>
</tbody>
</table>

Changing the Reconfirmation Interval

VMPS clients periodically reconfirm the VLAN membership information received from the VMPS. You can set the number of minutes after which reconfirmation occurs.

If you are configuring a member switch in a cluster, this parameter must be equal to or greater than the reconfirmation setting on the command switch. You must also first use the rcommand privileged EXEC command to log into the member switch.
Beginning in privileged EXEC mode, follow these steps to change the reconfirmation interval:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>vmps reconfirm minutes</td>
<td>Enter the number of minutes between reconfirmations of the dynamic VLAN membership. Enter a number from 1 to 120. The default is 60 minutes.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show vmps</td>
<td>Verify the dynamic VLAN reconfirmation status in the <em>Reconfirm Interval</em> field of the display.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no vmps reconfirm` global configuration command.

**Changing the Retry Count**

Beginning in privileged EXEC mode, follow these steps to change the number of times that the switch attempts to contact the VMPS before querying the next server:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>vmps retry count</td>
<td>Change the retry count. The retry range is from 1 to 10; the default is 3.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show vmps</td>
<td>Verify your entry in the <em>Server Retry Count</em> field of the display.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no vmps retry` global configuration command.

**Monitoring the VMPS**

You can display information about the VMPS by using the `show vmps` privileged EXEC command. The switch displays this information about the VMPS:

- **VMPS VQP Version**: The version of VQP used to communicate with the VMPS. The switch queries the VMPS that is using VQP version 1.
- **Reconfirm Interval**: The number of minutes the switch waits before reconfirming the VLAN-to-MAC-address assignments.
- **Server Retry Count**: The number of times VQP resends a query to the VMPS. If no response is received after this many tries, the switch starts to query the secondary VMPS.
This is an example of output for the `show vmps` privileged EXEC command:

```
Switch# show vmps

VQP Client Status:
-------------------
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.128.86 (primary, current)
                     172.20.128.87

Reconfirmation status
----------------------
VMPS Action: No Dynamic Port
```

**Troubleshooting Dynamic Port VLAN Membership**

The VMPS shuts down a dynamic port under these conditions:

- The VMPS is in secure mode, and it does not allow the host to connect to the port. The VMPS shuts down the port to prevent the host from connecting to the network.
- More than 20 active hosts reside on a dynamic port.

To re-enable a disabled dynamic port, enter the `no shutdown` interface configuration command.

**VMPS Configuration Example**

Figure 16-5 shows a network with a VMPS server switch and VMPS client switches with dynamic ports. In this example, these assumptions apply:

- The VMPS server and the VMPS client are separate switches.
- The Catalyst 6500 series Switch A is the primary VMPS server.
- The Catalyst 5000 series Switch C and Switch J are secondary VMPS servers.
- End stations are connected to the clients, Switch B and Switch I.
- The database configuration file is stored on the TFTP server with the IP address 172.20.22.7.

Configuring VTP

This chapter describes how to use the VLAN Trunking Protocol (VTP) and the VLAN database for managing VLANs on your Catalyst 2950 or Catalyst 2955 switch.

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

The chapter includes these sections:
- Understanding VTP, page 17-1
- Configuring VTP, page 17-6
- Monitoring VTP, page 17-15

Understanding VTP

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP minimizes misconfigurations and configuration inconsistencies that can cause several problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

Before you create VLANs, you must decide whether to use VTP in your network. Using VTP, you can make configuration changes centrally on one or more switches and have those changes automatically communicated to all the other switches in the network. Without VTP, you cannot send information about VLANs to other switches. VTP configuration information is saved in the VTP VLAN database.

VTP only learns about normal-range VLANs (VLAN IDs 1 to 1005). Extended-range VLANs (VLAN IDs greater than 1005) are not supported by VTP or stored in the VTP VLAN database.

This section contains information about these VTP parameters:
- The VTP Domain, page 17-2
- VTP Modes, page 17-2
- VTP Advertisements, page 17-3
- VTP Version 2, page 17-4
- VTP Pruning, page 17-4
The VTP Domain

A VTP domain (also called a VLAN management domain) consists of one switch or several interconnected switches under the same administrative responsibility sharing the same VTP domain name. A switch can be in only one VTP domain. You can make global VLAN configuration changes for the domain.

By default, the switch is in VTP no-management-domain state until it receives an advertisement for a domain over a trunk link (a link that carries the traffic of multiple VLANs) or until you configure a domain name. Until the management domain name is specified or learned, you cannot create or modify VLANs on a VTP server, and VLAN information is not propagated over the network.

If the switch receives a VTP advertisement over a trunk link, it inherits the management domain name and the VTP configuration revision number. The switch then ignores advertisements with a different domain name or an earlier configuration revision number.

Caution

Before adding a VTP client switch to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other switches in the VTP domain. Switches in a VTP domain always use the VLAN configuration of the switch with the highest VTP configuration revision number. If you add a switch that has a revision number higher than the revision number in the VTP domain, it can erase all VLAN information from the VTP server and VTP domain. See the “Adding a VTP Client Switch to a VTP Domain” section on page 17-14 for the procedure for verifying and resetting the VTP configuration revision number.

When you make a change to the VLAN configuration on a VTP server, the change is propagated to all switches in the VTP domain. VTP advertisements are sent over all IEEE 802.1Q trunk connections. VTP maps VLANs dynamically across multiple LAN types with unique names and internal index associates. Mapping eliminates excessive device administration required from network administrators.

If you configure a switch for VTP transparent mode, you can create and modify VLANs, but the changes are not sent to other switches in the domain, and they affect only the individual switch. However, configuration changes made when the switch is in this mode are saved in the switch running configuration and can be saved to the switch startup configuration file.

For domain name and password configuration guidelines, see the “VTP Configuration Guidelines” section on page 17-8.

VTP Modes

You can configure a supported switch to be in one of the VTP modes listed in Table 17-1.

<table>
<thead>
<tr>
<th>VTP Mode</th>
<th>Description</th>
</tr>

<tbody>
<tr>
<td>VTP server</td>
<td>In VTP server mode, you can create, modify, and delete VLANs and specify other configuration parameters (such as the VTP version) for the entire VTP domain. VTP servers advertise their VLAN configurations to other switches in the same VTP domain and synchronize their VLAN configurations with other switches based on advertisements received over trunk links. In VTP server mode, VLAN configurations are saved in NVRAM. VTP server is the default mode.</td>
</tr>
</tbody>
</table>
When the network is configured with more than the maximum 250 VLANs supported by the Catalyst 2950 switches running the enhanced software image (EI), or 128 VLANs supported by the Catalyst 2950 switches running the standard software image (SI), the switch automatically changes from VTP server or client mode to VTP transparent mode. The switch then operates with the VLAN configuration that preceded the one that sent it into transparent mode.

**VTP Advertisements**

Each switch in the VTP domain sends periodic global configuration advertisements from each trunk port to a reserved multicast address. Neighboring switches receive these advertisements and update their VTP and VLAN configurations as necessary.

**Note**

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the switch and that this trunk port is connected to the trunk port of a second switch. Otherwise, the switch cannot receive any VTP advertisements. For more information on trunk ports, see the "Configuring VLAN Trunks" section on page 16-13.

VTP advertisements distribute this global domain information:

- VTP domain name
- VTP configuration revision number
- Update identity and update timestamp
- MD5 digest VLAN configuration, including maximum transmission unit (MTU) size for each VLAN.
- Frame format

VTP advertisements distribute this VLAN information for each configured VLAN:

- VLAN IDs
- VLAN name
- VLAN type
VTP Version 2

If you use VTP in your network, you must decide whether to use version 1 or version 2. By default, VTP operates in version 1.

VTP version 2 supports these features not supported in version 1:

- Token Ring support—VTP version 2 supports Token Ring Bridge Relay Function (TrBRF) and Token Ring Concentrator Relay Function (TrCRF) VLANs. For more information about Token Ring VLANs, see the “Configuring Normal-Range VLANs” section on page 16-4.

- Unrecognized Type-Length-Value (TLV) support—A VTP server or client propagates configuration changes to its other trunks, even for TLVs it is not able to parse. The unrecognized TLV is saved in NVRAM when the switch is operating in VTP server mode.

- Version-Dependent Transparent Mode—In VTP version 1, a VTP transparent switch inspects VTP messages for the domain name and version and forwards a message only if the version and domain name match. Because VTP version 2 supports only one domain, it forwards VTP messages in transparent mode without inspecting the version and domain name.

- Consistency Checks—In VTP version 2, VLAN consistency checks (such as VLAN names and values) are performed only when you enter new information through the CLI or SNMP. Consistency checks are not performed when new information is obtained from a VTP message or when information is read from NVRAM. If the MD5 digest on a received VTP message is correct, its information is accepted.

VTP Pruning

VTP pruning increases network available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to reach the destination devices. Without VTP pruning, a switch floods broadcast, multicast, and unknown unicast traffic across all trunk links within a VTP domain even though receiving switches might discard them. VTP pruning is disabled by default.

VTP pruning blocks unneeded flooded traffic to VLANs on trunk ports that are included in the pruning-eligible list. Only VLANs included in the pruning-eligible list can be pruned. By default, VLANs 2 through 1001 are pruning eligible switch trunk ports. If the VLANs are configured as pruning-ineligible, the flooding continues. VTP pruning is supported with VTP version 1 and version 2.

Figure 17-1 shows a switched network without VTP pruning enabled. Port 1 on Switch A and Port 2 on Switch D are assigned to the Red VLAN. If a broadcast is sent from the host connected to Switch A, Switch A floods the broadcast and every switch in the network receives it, even though Switches C, E, and F have no ports in the Red VLAN.
Figure 17-1  Flooding Traffic without VTP Pruning

Figure 17-2 shows a switched network with VTP pruning enabled. The broadcast traffic from Switch A is not forwarded to Switches C, E, and F because traffic for the Red VLAN has been pruned on the links shown (Port 5 on Switch B and Port 4 on Switch D).

Figure 17-2  Optimized Flooded Traffic with VTP Pruning

Enabling VTP pruning on a VTP server enables pruning for the entire management domain. Making VLANs pruning-eligible or pruning-ineligible affects pruning eligibility for those VLANs on that device only (not on all switches in the VTP domain). See the “Enabling VTP Pruning” section on page 17-14.

VTP pruning takes effect several seconds after you enable it. VTP pruning does not prune traffic from VLANs that are pruning-ineligible. VLAN 1 and VLANs 1002 to 1005 are always pruning-ineligible; traffic from these VLANs cannot be pruned. Extended-range VLANs (VLAN IDs higher than 1005) are also pruning-ineligible.

VTP pruning is not designed to function in VTP transparent mode. If one or more switches in the network are in VTP transparent mode, you should do one of these:

- Turn off VTP pruning in the entire network.
• Turn off VTP pruning by making all VLANs on the trunk of the switch upstream to the VTP transparent switch pruning ineligible.

To configure VTP pruning on an interface, use the **switchport trunk pruning vlan** interface configuration command (see the “Changing the Pruning- Eligible List” section on page 16-19). VTP pruning operates when an interface is trunking. You can set VLAN pruning-eligibility, whether or not VTP pruning is enabled for the VTP domain, whether or not any given VLAN exists, and whether or not the interface is currently trunking.

### Configuring VTP

This section includes guidelines and procedures for configuring VTP. These sections are included:

- Default VTP Configuration, page 17-6
- VTP Configuration Options, page 17-6
- VTP Configuration Guidelines, page 17-8
- Configuring a VTP Server, page 17-9
- Configuring a VTP Client, page 17-11
- Disabling VTP (VTP Transparent Mode), page 17-12
- Enabling VTP Version 2, page 17-13
- Enabling VTP Pruning, page 17-14
- Adding a VTP Client Switch to a VTP Domain, page 17-14

### Default VTP Configuration

Table 17-2 shows the default VTP configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTP domain name</td>
<td>Null.</td>
</tr>
<tr>
<td>VTP mode</td>
<td>Server.</td>
</tr>
<tr>
<td>VTP version 2 enable state</td>
<td>Version 2 is disabled.</td>
</tr>
<tr>
<td>VTP password</td>
<td>None.</td>
</tr>
<tr>
<td>VTP pruning</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>

### VTP Configuration Options

You can configure VTP by using these configuration modes.

- VTP Configuration in Global Configuration Mode, page 17-7
- VTP Configuration in VLAN Configuration Mode, page 17-7

You access VLAN configuration mode by entering the **vlan database** privileged EXEC command. For detailed information about vtp commands, see the command reference for this release.
VTP Configuration in Global Configuration Mode

You can use the `vtp` global configuration command to set the VTP password, the version, the VTP file name, the interface providing updated VTP information, the domain name, and the mode, and to disable or enable pruning. For more information about available keywords, see the command descriptions in the command reference for this release. The VTP information is saved in the VTP VLAN database. When VTP mode is transparent, the VTP domain name and mode are also saved in the switch running configuration file, and you can save it in the switch startup configuration file by entering the `copy running-config startup-config` privileged EXEC command. You must use this command if you want to save VTP mode as transparent, even if the switch resets.

When you save VTP information in the switch startup configuration file and reboot the switch, the switch configuration is determined as follows:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for the first 1005 VLAN IDs use the VLAN database information.
- If the switch is running IOS Release 12.1(9)EA1 or later and you use an older configuration file to boot up the switch, the configuration file does not contain VTP or VLAN information, and the switch uses the VLAN database configurations.
- If the switch is running an IOS release earlier than 12.1(9)EA1 on the switch and you use a configuration file from IOS Release 12.1(9)EA1 or later to boot up the switch, the image on the switch does not recognize VLAN and VTP configurations in the configuration file, so the switch uses the VLAN database configuration.

VTP Configuration in VLAN Configuration Mode

You can configure all VTP parameters in VLAN configuration mode, which you access by entering the `vlan database` privileged EXEC command. For more information about available keywords, see the `vtp` VLAN configuration command description in the command reference for this release. When you enter the `exit` command in VLAN configuration mode, it applies all the commands that you entered and updates the VLAN database. VTP messages are sent to other switches in the VTP domain, and the privileged EXEC mode prompt appears.

If VTP mode is transparent, the domain name and the mode (transparent) are saved in the switch running configuration, and you can save this information in the switch startup configuration file by entering the `copy running-config startup-config` privileged EXEC command.
Chapter 17 Configuring VTP

VTP Configuration Guidelines

These sections describe guidelines you should follow when implementing VTP in your network.

Domain Names

When configuring VTP for the first time, you must always assign a domain name. You must configure all switches in the VTP domain with the same domain name. Switches in VTP transparent mode do not exchange VTP messages with other switches, and you do not need to configure a VTP domain name for them.

Note

If NVRAM and DRAM storage is sufficient, all switches in a VTP domain should be in VTP server mode.

Caution

Do not configure a VTP domain if all switches are operating in VTP client mode. If you configure the domain, it is impossible to make changes to the VLAN configuration of that domain. Make sure that you configure at least one switch in the VTP domain for VTP server mode.

Passwords

You can configure a password for the VTP domain, but it is not required. If you do configure a domain password, all domain switches must share the same password and you must configure the password on each switch in the management domain. Switches without a password or with the wrong password reject VTP advertisements.

If you configure a VTP password for a domain, a switch that is booted without a VTP configuration does not accept VTP advertisements until you configure it with the correct password. After the configuration, the switch accepts the next VTP advertisement that uses the same password and domain name in the advertisement.

If you are adding a new switch to an existing network with VTP capability, the new switch learns the domain name only after the applicable password has been configured on it.

Caution

When you configure a VTP domain password, the management domain does not function properly if you do not assign a management domain password to each switch in the domain.

Upgrading from Previous Software Releases

When you upgrade from an IOS software version that supports VLANs but does not support VTP, such as Release 12.0(5.1)WC, to a version that does support VTP, ports that belong to a VLAN retain their VLAN membership, and VTP enters transparent mode. The domain name becomes UPGRADE, and VTP does not propagate the VLAN configuration to other switches.

If you want the switch to propagate VLAN configuration information to other switches and to learn the VLANs enabled on the network, you must configure the switch with the correct domain name and domain password and change the VTP mode to VTP server.
VTP Version

Follow these guidelines when deciding which VTP version to implement:

- All switches in a VTP domain must run the same VTP version.
- A VTP version 2-capable switch can operate in the same VTP domain as a switch running VTP version 1 if version 2 is disabled on the version 2-capable switch (version 2 is disabled by default).
- Do not enable VTP version 2 on a switch unless all of the switches in the same VTP domain are version-2-capable. When you enable version 2 on a switch, all of the version-2-capable switches in the domain enable version 2. If there is a version 1-only switch, it does not exchange VTP information with switches with version 2 enabled.
- If there are TrBRF and TrCRF Token Ring networks in your environment, you must enable VTP version 2 for Token Ring VLAN switching to function properly. To run Token Ring and Token Ring-Net, disable VTP version 2.

Configuration Requirements

When you configure VTP, you must configure a trunk port so that the switch can send and receive VTP advertisements. For more information, see the “Configuring VLAN Trunks” section on page 16-13.

If you are configuring VTP on a cluster member switch to a VLAN, use the `rcommand` privileged EXEC command to log into the member switch. For more information about the command, see the command reference for this release.

If you are configuring extended-range VLANs on the switch, the switch must be in VTP transparent mode.

Configuring a VTP Server

When a switch is in VTP server mode, you can change the VLAN configuration and have it propagated throughout the network.

**Note**

If extended-range VLANs are configured on the switch, you cannot change VTP mode to server. You receive an error message, and the configuration is not allowed.

Beginning in privileged EXEC mode, follow these steps to configure the switch as a VTP server:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>vtp mode server</code></td>
<td>Configure the switch for VTP server mode (the default).</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>vtp domain domain-name</code></td>
<td>Configure the VTP administrative-domain name. The name can be from 1 to 32 characters. All switches operating in VTP server or client mode under the same administrative responsibility must be configured with the same domain name.</td>
</tr>
</tbody>
</table>
### Configuring VTP

#### Step 4

**Command:** `vtp password password`  
**Purpose:** (Optional) Set the password for the VTP domain. The password can be from 8 to 64 characters. 
If you configure a VTP password, the VTP domain does not function properly if you do not assign the same password to each switch in the domain.

#### Step 5

**Command:** `end`  
**Purpose:** Return to privileged EXEC mode.

#### Step 6

**Command:** `show vtp status`  
**Purpose:** Verify your entries in the **VTP Operating Mode** and the **VTP Domain Name** fields of the display.

---

When you configure a domain name, it cannot be removed; you can only reassign a switch to a different domain.

To return the switch to a no-password state, use the `no vtp password` global configuration command.

This example shows how to use global configuration mode to configure the switch as a VTP server with the domain name `eng_group` and the password `mypassword`:

```
Switch# config terminal
Switch(config)# vtp mode server
Switch(config)# vtp domain eng_group
Switch(config)# vtp password mypassword
Switch(config)# end
```

You can also use VLAN configuration mode to configure VTP parameters. Beginning in privileged EXEC mode, follow these steps to use VLAN configuration mode to configure the switch as a VTP server:

### VLAN Configuration Mode

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>vlan database</code> Enter VLAN configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>vtp server</code> Configure the switch for VTP server mode (the default).</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>vtp domain domain-name</code> Configure a VTP administrative-domain name. The name can be from 1 to 32 characters. All switches operating in VTP server or client mode under the same administrative responsibility must be configured with the same domain name.</td>
</tr>
</tbody>
</table>
| **Step 4** | `vtp password password` (Optional) Set a password for the VTP domain. The password can be from 8 to 64 characters. 
If you configure a VTP password, the VTP domain does not function properly if you do not assign the same password to each switch in the domain. |
| **Step 5** | `exit` Update the VLAN database, propagate it throughout the administrative domain, and return to privileged EXEC mode. |
| **Step 6** | `show vtp status` Verify your entries in the **VTP Operating Mode** and the **VTP Domain Name** fields of the display. |

When you configure a domain name, it cannot be removed; you can only reassign a switch to a different domain.

To return the switch to a no-password state, use the `no vtp password` VLAN configuration command.
This example shows how to use VLAN configuration mode to configure the switch as a VTP server with the domain name *eng_group* and the password *mypassword*:

```
Switch# vlan database
Switch(vlan)# vtp server
Switch(vlan)# vtp domain eng_group
Switch(vlan)# vtp password mypassword
Switch(vlan)# exit
APPLY completed.
Exiting....
```

### Configuring a VTP Client

When a switch is in VTP client mode, you cannot change its VLAN configuration. The client switch receives VTP updates from a VTP server in the VTP domain and then modifies its configuration accordingly.

**Note**
If extended-range VLANs are configured on the switch, you cannot change VTP mode to client. You receive an error message, and the configuration is not allowed.

**Note**
If you configure the switch for VTP client mode, the switch does not create the VLAN database file (vlan.dat). If the switch is then powered off, it resets the VTP configuration to the default. To keep the VTP configuration with VTP client mode after the switch restarts, you must first configure the VTP domain name before the VTP mode.

**Caution**
If all switches are operating in VTP client mode, do not configure a VTP domain name. If you do, it is impossible to make changes to the VLAN configuration of that domain. Therefore, make sure you configure at least one switch as a VTP server.

Beginning in privileged EXEC mode, follow these steps to configure the switch as a VTP client:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>vtp mode client</td>
<td>Configure the switch for VTP client mode. The default setting is VTP server.</td>
</tr>
<tr>
<td>3</td>
<td>vtp domain <em>domain-name</em></td>
<td>(Optional) Enter the VTP administrative-domain name. The name can be from 1 to 32 characters. This should be the same domain name as the VTP server. All switches operating in VTP server or client mode under the same administrative responsibility must be configured with the same domain name.</td>
</tr>
<tr>
<td>4</td>
<td>vtp password <em>password</em></td>
<td>(Optional) Enter the password for the VTP domain.</td>
</tr>
</tbody>
</table>
Use the `no vtp mode` global configuration command to return the switch to VTP server mode. To return the switch to a no-password state, use the `no vtp password` global configuration command. When you configure a domain name, it cannot be removed; you can only reassign a switch to a different domain.

Note
You can also configure a VTP client by using the `vlan database` privileged EXEC command to enter VLAN configuration mode and entering the `vtp client` command, similar to the second procedure under “Configuring a VTP Server” section on page 17-9. Use the `no vtp client` VLAN configuration command to return the switch to VTP server mode or the `no vtp password` VLAN configuration command to return the switch to a no-password state. When you configure a domain name, it cannot be removed; you can only reassign a switch to a different domain.

### Disabling VTP (VTP Transparent Mode)

When you configure the switch for VTP transparent mode, VTP is disabled on the switch. The switch does not send VTP updates and does not act on VTP updates received from other switches. However, a VTP transparent switch running VTP version 2 does forward received VTP advertisements on its trunk links.

Note
Before you create extended-range VLANs (VLAN IDs 1006 to 4094), you must set VTP mode to transparent by using the `vtp mode transparent` global configuration command. Save this configuration to the startup configuration so that the switch boots up in VTP transparent mode. Otherwise, you lose the extended-range VLAN configuration if the switch resets and boots up in VTP server mode (the default).

Beginning in privileged EXEC mode, follow these steps to configure VTP transparent mode and save the VTP configuration in the switch startup configuration file:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 vtp mode transparent</td>
<td>Configure the switch for VTP transparent mode (disable VTP).</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show vtp status</td>
<td>Verify your entries in the <code>VTP Operating Mode</code> and the <code>VTP Domain Name</code> fields of the display.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save the configuration in the startup configuration file.</td>
</tr>
</tbody>
</table>

Note
Only VTP mode and domain name are saved in the switch running configuration and can be copied to the startup configuration file.

To return the switch to VTP server mode, use the `no vtp mode` global configuration command.
Chapter 17 Configuring VTP

Configuring VTP

Note
If extended-range VLANs are configured on the switch, you cannot change VTP mode to server. You receive an error message, and the configuration is not allowed.

Note
You can also configure VTP transparent mode by using the `vlan database` privileged EXEC command to enter VLAN configuration mode and by entering the `vtp transparent` command, similar to the second procedure under the “Configuring a VTP Server” section on page 17-9. Use the `no vtp transparent` VLAN configuration command to return the switch to VTP server mode. If extended-range VLANs are configured on the switch, you cannot change VTP mode to server. You receive an error message, and the configuration is not allowed.

Enabling VTP Version 2

VTP version 2 is disabled by default on VTP version 2-capable switches. When you enable VTP version 2 on a switch, every VTP version 2-capable switch in the VTP domain enables version 2. You can only configure the version on switches in VTP server or transparent mode.

Caution
VTP version 1 and VTP version 2 are not interoperable on switches in the same VTP domain. Every switch in the VTP domain must use the same VTP version. Do not enable VTP version 2 unless every switch in the VTP domain supports version 2.

Note
In TrCRF and TrBRF Token ring environments, you must enable VTP version 2 for Token Ring VLAN switching to function properly. For Token Ring and Token Ring-Net media, VTP version 2 must be disabled.

For more information on VTP version configuration guidelines, see the “VTP Version” section on page 17-9.

Beginning in privileged EXEC mode, follow these steps to enable VTP version 2:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 vtp version 2</td>
<td>Enable VTP version 2 on the switch.</td>
</tr>
<tr>
<td></td>
<td>VTP version 2 is disabled by default on VTP version 2-capable switches.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show vtp status</td>
<td>Verify that VTP version 2 is enabled in the VTP V2 Mode field of the display.</td>
</tr>
</tbody>
</table>

To disable VTP version 2, use the `no vtp version` global configuration command.

Note
You can also enable VTP version 2 by using the `vlan database` privileged EXEC command to enter VLAN configuration mode and entering the `vtp v2-mode` VLAN configuration command. To disable VTP version 2, use the `no vtp v2-mode` VLAN configuration command.
Enabling VTP Pruning

Pruning increases available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to access the destination devices. You can only enable VTP pruning on a switch in VTP server mode.

Beginning in privileged EXEC mode, follow these steps to enable VTP pruning in the VTP domain:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 vtp pruning</td>
<td>Enable pruning in the VTP administrative domain. By default, pruning is disabled. You need to enable pruning on only one switch in VTP server mode.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show vtp status</td>
<td>Verify your entries in the VTP Pruning Mode field of the display.</td>
</tr>
</tbody>
</table>

To disable VTP pruning, use the `no vtp pruning` global configuration command.

**Note**

You can also enable VTP pruning by using the `vlan database` privileged EXEC command to enter VLAN configuration mode and entering the `vtp pruning` VLAN configuration command. To disable VTP pruning, use the `no vtp pruning` VLAN configuration command.

Pruning is supported with VTP version 1 and version 2. If you enable pruning on the VTP server, it is enabled for the entire VTP domain.

Only VLANs included in the pruning-eligible list can be pruned. By default, VLANs 2 through 1001 are pruning eligible on trunk ports. Extended-range VLANs cannot be pruned. To change the pruning-eligible VLANs, see the “Changing the Pruning-Eligible List” section on page 16-19.

Adding a VTP Client Switch to a VTP Domain

Before adding a VTP client to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other switches in the VTP domain. Switches in a VTP domain always use the VLAN configuration of the switch with the highest VTP configuration revision number. If you add a switch that has a revision number higher than the revision number in the VTP domain, it can erase all VLAN information from the VTP server and VTP domain.
Beginning in privileged EXEC mode, follow these steps to verify and reset the VTP configuration revision number on a switch before adding it to a VTP domain:

You can also change the VTP domain name by entering the `vlan database` privileged EXEC command to enter VLAN configuration mode and by entering the `vtp domain domain-name` command. In this mode, you must enter the `exit` command to update VLAN information and return to privileged EXEC mode.

After resetting the configuration revision number, add the switch to the VTP domain.

**Note**

You can use the `vtp mode transparent` global configuration command or the `vtp transparent` VLAN configuration command to disable VTP on the switch, and then change its VLAN information without affecting the other switches in the VTP domain.

### Monitoring VTP

You monitor VTP by displaying VTP configuration information: the domain name, the current VTP revision, and the number of VLANs. You can also display statistics about the advertisements sent and received by the switch.

Table 17-3 shows the privileged EXEC commands for monitoring VTP activity.
### Table 17-3   **VTP Monitoring Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp status</td>
<td>Display the VTP switch configuration information.</td>
</tr>
<tr>
<td>show vtp counters</td>
<td>Display counters about VTP messages that have been sent and received.</td>
</tr>
</tbody>
</table>
Configuring Voice VLAN

This chapter describes how to configure the voice VLAN feature on your Catalyst 2950 or Catalyst 2955 switch. Voice VLAN is sometimes referred to as an *auxiliary VLAN* in the Catalyst 6000 family switch documentation.

**Note**
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:
- Understanding Voice VLAN, page 18-1
- Configuring Voice VLAN, page 18-2
- Displaying Voice VLAN, page 18-6

**Understanding Voice VLAN**

The voice VLAN feature enables access ports to carry IP voice traffic from an IP phone. The switch can connect to a Cisco 7960 IP Phone and carry IP voice traffic. Because the sound quality of an IP phone call can deteriorate if the data is unevenly sent, the switch supports quality of service (QoS) based on IEEE 802.1p class of service (CoS). QoS uses classification and scheduling to send network traffic from the switch in a predictable manner. For more information on QoS, see Chapter 29, “Configuring QoS.” The Cisco 7960 IP Phone is a configurable device, and you can configure it to forward traffic with an IEEE 802.1p priority. You can configure the switch to trust or override the traffic priority assigned by an IP Phone.

The Cisco 7960 IP Phone contains an integrated three-port 10/100 switch as shown in Figure 18-1. The ports provide dedicated connections to these devices:
- Port 1 connects to the switch or other voice-over-IP (VoIP) device.
- Port 2 is an internal 10/100 interface that carries the IP phone traffic.
- Port 3 (access port) connects to a PC or other device.

*Figure 18-1 shows one way to connect a Cisco 7960 IP Phone.*
When the IP Phone connects to the switch, the access port (PC-to-telephone jack) of the IP phone can connect to a PC. Packets to and from the PC and to or from the IP phone share the same physical link to the switch and the same switch port. For deployment examples that use voice VLANs, see the “Network Configuration Examples” section on page 1-11.

**Figure 18-1  Cisco 7960 IP Phone Connected to a Switch**

When the IP Phone connects to the switch, the access port (PC-to-telephone jack) of the IP phone can connect to a PC. Packets to and from the PC and to or from the IP phone share the same physical link to the switch and the same switch port. For deployment examples that use voice VLANs, see the “Network Configuration Examples” section on page 1-11.

### Configuring Voice VLAN

This section describes how to configure voice VLAN on access ports. It contains this configuration information:

- Default Voice VLAN Configuration, page 18-2
- Voice VLAN Configuration Guidelines, page 18-3
- Configuring a Port to Connect to a Cisco 7960 IP Phone, page 18-3

#### Default Voice VLAN Configuration

The voice VLAN feature is disabled by default.

When the voice VLAN feature is enabled, all untagged traffic is sent according to the default CoS priority of the port.

The default CoS value is 0 for incoming traffic.

The CoS value is not trusted for IEEE 802.1p or IEEE 802.1Q tagged traffic.

The IP Phone overrides the priority of all incoming traffic (tagged and untagged) and sets the CoS value to 0.

**Note**

In software releases earlier than Cisco IOS Release 12.1(13)EA1, the CoS value is trusted for all IEEE 802.1p or IEEE 802.1Q tagged traffic, and the IP Phone does not override the priority of the incoming traffic.
Voice VLAN Configuration Guidelines

These are the voice VLAN configuration guidelines:

- You should configure voice VLAN on switch access ports.
- The voice VLAN should be present and active on the switch for the IP phone to correctly communicate on the voice VLAN. Use the `show vlan` privileged EXEC command to see if the VLAN is present (listed in the display). If the VLAN is not listed, see Chapter 16, “Configuring VLANs” for information on how to create the VLAN.
- The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.
- When you enable port security on an interface that is also configured with a voice VLAN, you must set the maximum allowed secure addresses on the port to at least two plus the maximum number of secure addresses allowed on the access VLAN. When the port is connected to a Cisco IP phone, the IP phone requires up to two MAC addresses. The address of the IP phone is learned on the voice VLAN, and it might or might not be learned on the access VLAN. Connecting a PC to the IP phone requires additional MAC addresses.
- If any type of port security is enabled on the access VLAN, dynamic port security is automatically enabled on the voice VLAN.
- You cannot configure port security on a per-VLAN basis.
- You cannot configure static secure or sticky secure MAC addresses on a voice VLAN.
- Voice VLAN ports can also be these port types:
  - Dynamic access port. See the “Configuring Dynamic Access Ports on VMPS Clients” section on page 16-26 for more information.
  - Secure port. See the “Configuring Port Security” section on page 21-6 for more information.
  - IEEE 802.1x authenticated port. See the “Using IEEE 802.1x Authentication with Voice VLAN Ports” section on page 9-10 for more information.

Note

If you enable IEEE 802.1x on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the Cisco IP Phone loses connectivity to the switch for up to 30 seconds.

- Protected port. See the “Configuring Protected Ports” section on page 21-4 for more information.

Configuring a Port to Connect to a Cisco 7960 IP Phone

Because a Cisco 7960 IP Phone also supports a connection to a PC or other device, a port connecting the switch to a Cisco 7960 IP Phone can carry mixed traffic.

You can configure the port to carry voice traffic in one of these ways:

- Configuring Ports to Carry Voice Traffic in IEEE 802.1Q Frames, page 18-4
- Configuring Ports to Carry Voice Traffic in IEEE 802.1p Priority-Tagged Frames, page 18-4

You can configure the IP phone to carry data traffic in one of these ways:

- Overriding the CoS Priority of Incoming Data Frames, page 18-5
Chapter 18 Configuring Voice VLAN

- Configuring the IP Phone to Trust the CoS Priority of Incoming Data Frames, page 18-5

Configuring Ports to Carry Voice Traffic in IEEE 802.1Q Frames

Beginning in privileged EXEC mode, follow these steps to configure a port to carry voice traffic in IEEE 802.1Q frames for a specific VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface connected to the IP phone, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 switchport voice vlan vlan-id</td>
<td>Instruct the Cisco IP Phone to forward all voice traffic through the specified VLAN. By default, the Cisco IP Phone forwards the voice traffic with an IEEE 802.1Q priority of 5. Valid VLAN IDs are from 1 to 4094.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show interfaces interface-id switchport</td>
<td>Verify your voice VLAN entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove voice VLAN, use the no switchport voice vlan interface configuration command or the switchport voice vlan none interface configuration command.

Configuring Ports to Carry Voice Traffic in IEEE 802.1p Priority-Tagged Frames

Beginning in privileged EXEC mode, follow these steps to configure a port to instruct the IP phone to give voice traffic a higher priority and to forward all traffic through the native VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface connected to the IP phone, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 switchport voice vlan dot1p</td>
<td>Instruct the switch port to use IEEE 802.1p priority tagging for voice traffic and to use the default native VLAN (VLAN 1) to carry all traffic. By default, the Cisco IP phone forwards the voice traffic with an IEEE 802.1p priority of 5.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show interfaces interface-id switchport</td>
<td>Verify your voice VLAN entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the port to its default setting, use the no switchport voice vlan interface configuration command.
Overriding the CoS Priority of Incoming Data Frames

You can connect a PC or other data device to a Cisco 7960 IP Phone port. The PC can generate packets with an assigned CoS value. You can configure the switch to override the priority of frames arriving on the IP phone port from connected devices.

Beginning in privileged EXEC mode, follow these steps to override the CoS priority received from the nonvoice port on the Cisco 7960 IP Phone:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter interface configuration mode, and specify the interface connected to the IP phone.</td>
</tr>
<tr>
<td>Step 3 switchport priority extend</td>
<td>Set the IP phone access port to override the priority received from the PC or the attached device.</td>
</tr>
<tr>
<td>cos value</td>
<td>The CoS value is a number from 0 to 7. Seven is the highest priority. The default is 0.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show interfaces interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>switchport</td>
<td></td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no switchport priority extend interface configuration command or the switchport priority extend cos 0 interface configuration command to return the port to its default setting.

Configuring the IP Phone to Trust the CoS Priority of Incoming Data Frames

You can connect a PC or other data device to a Cisco 7960 IP Phone port. The PC can generate packets with an assigned CoS value. You can configure the switch to trust the priority of frames arriving on the IP phone port from connected devices.

Beginning in privileged EXEC mode, follow these steps to trust the CoS priority received from the nonvoice port on the Cisco 7960 IP Phone:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter interface configuration mode, and specify the interface connected to the IP phone.</td>
</tr>
<tr>
<td>Step 3 switchport priority extend</td>
<td>Set the IP phone access port to trust the priority received from the PC or the attached device.</td>
</tr>
<tr>
<td>trust</td>
<td></td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show interfaces interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>switchport</td>
<td></td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Use the `no switchport priority extend` interface configuration command or the `switchport priority extend cos 0` interface configuration command to return the port to its default setting.

**Displaying Voice VLAN**

To display voice VLAN for an interface, use the `show interfaces interface-id switchport` privileged EXEC command.

For detailed information about the fields in the display, see the command reference for this release.
Configuring Port-Based Traffic Control

This chapter describes how to configure the port-based traffic control features on your Catalyst 2950 or Catalyst 2955 switch.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Configuring Storm Control, page 21-1
- Configuring Protected Ports, page 21-4
- Configuring Port Blocking, page 21-5
- Configuring Port Security, page 21-6
- Displaying Port-Based Traffic Control Settings, page 21-13

Configuring Storm Control

These sections include storm control configuration information and procedures:

- Understanding Storm Control, page 21-1
- Default Storm Control Configuration, page 21-2
- Configuring Storm Control and Threshold Levels, page 21-2

Understanding Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on a port. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configuration, or users issuing a denial-of-service attack can cause a storm.

Storm control is configured for the switch as a whole but operates on a per-port basis. By default, storm control is disabled.

Storm control uses rising and falling thresholds to block and then restore the forwarding of broadcast, unicast, or multicast packets. You can also set the switch to shut down the port when the rising threshold is reached.
Storm control uses one of these methods to measure traffic activity:

- Bandwidth based
- Traffic rate at which packets are received (in packets per second) (available only on non-Long-Reach Ethernet [LRE] Catalyst 2950 switches)

The thresholds can either be expressed as a percentage of the total available bandwidth that can be used by the broadcast, multicast, or unicast traffic, or as the rate at which the interface receives multicast, broadcast, or unicast traffic.

When a switch uses the bandwidth-based method, the rising threshold is the percentage of total available bandwidth associated with multicast, broadcast, or unicast traffic before forwarding is blocked. The falling threshold is the percentage of total available bandwidth below which the switch resumes normal forwarding. In general, the higher the level, the less effective the protection against broadcast storms.

When a non-LRE Catalyst 2950 switch running Cisco IOS Release 12.1(14)EA1 or later uses traffic rates as the threshold values, the rising and falling thresholds are in packets per second. The rising threshold is the rate at which multicast, broadcast, and unicast traffic is received before forwarding is blocked. The falling threshold is the rate below which the switch resumes normal forwarding. In general, the higher the rate, the less effective the protection against broadcast storms.

**Default Storm Control Configuration**

By default, broadcast, multicast, and unicast storm control is disabled on the switch. The default action is to filter traffic and to not send an SNMP trap.

**Configuring Storm Control and Threshold Levels**

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel, although you cannot configure storm control on the individual ports of that channel.

**Note**

When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces. In the `show etherchannel` privileged EXEC command output, the storm control settings appear on the EtherChannel but not on the physical port of the channel.

Beginning in privileged EXEC mode, follow these steps to configure storm control and threshold levels:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code></td>
<td>Specify the port to configure, and enter interface configuration mode.</td>
</tr>
</tbody>
</table>
Configuring Storm Control

To disable storm control, use the `no storm-control broadcast level`, the `no storm-control multicast level`, or the `no storm-control unicast level` interface configuration command.

This example shows how to enable broadcast address storm control on a port to a level of 20 percent. When the broadcast traffic exceeds the configured level of 20 percent of the available bandwidth of the port within the traffic-storm-control interval, the switch drops all broadcast traffic until the end of the traffic-storm-control interval:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# storm-control broadcast level 20
```

If you configure the action to be taken when a packet storm is detected as `shutdown` (the port is error-disabled during a storm), you must use the `no shutdown` interface configuration command to bring the interface out of this state. If you do not specify the `shutdown` action, specify the action as `trap` (the switch generates a trap when a storm is detected).
Configuring Protected Ports

Some applications require that no traffic be forwarded between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.
- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.
- Protected ports are supported on IEEE 802.1Q trunks.

The default is to have no protected ports defined.

You can configure protected ports on a physical interface or an EtherChannel group. When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

Both LRE interface ports and CPE device ports can be configured as protected ports. When you use a Cisco 575 LRE CPE or a Cisco 576 LRE 997 CPE device, the cpe protected interface configuration command is not available.

When you use a Cisco 585 LRE CPE device (which has multiple Ethernet interfaces), the switchport protected command allows devices on different ports of the same CPE device to exchange data locally.

In some cases, you might want to protect individual CPE device ports. You can do this with the cpe protected interface configuration command. Devices connected to different ports on the same CPE device cannot exchange data directly but must forward it through a Layer 3 device.

Beginning in privileged EXEC mode, follow these steps to define a port as a protected port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>switchport protected</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show interfaces interface-id switchport</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable protected port, use the no switchport protected interface configuration command.

This example shows how to configure a port as a protected port:

```
Switch# configure terminal
Switch(config)# interface fastethernet0/1
Switch(config-if)# switchport protected
Switch(config-if)# end
```
Configuring Port Blocking

By default, the switch floods packets with unknown destination MAC addresses to all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues.

To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can configure a port (protected or nonprotected) to block unknown unicast or multicast packets.

Note

Blocking unicast or multicast traffic is not automatically enabled on protected ports; you must explicitly configure it.

The port blocking feature is only supported on these switches:
- Catalyst 2950 Long-Reach Ethernet (LRE) switches running Cisco IOS Release 12.1(14)EA1 or later
- Catalyst 2950G-12-EI, 2950G-24-EI, 2950G-24-EI-DC, 2950G-48-EI, and 2955 switches running Cisco IOS Release 12.1(19)EA1 or later

Blocking Flooded Traffic on an Interface

Note

The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port channel group.

Beginning in privileged EXEC mode, follow these steps to disable the flooding of multicast and unicast packets to an interface:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
<td>Specify the interface to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>switchport block multicast</td>
<td>Block unknown multicast forwarding to the port.</td>
</tr>
<tr>
<td>4</td>
<td>switchport block unicast</td>
<td>Block unknown unicast forwarding to the port.</td>
</tr>
<tr>
<td>5</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>6</td>
<td>show interfaces interface-id switchport</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>7</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the interface to the default condition where no traffic is blocked, use the no switchport block {multicast | unicast} interface configuration commands.

This example shows how to block unicast and multicast flooding on a port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport block multicast
Switch(config-if)# switchport block unicast
Switch(config-if)# end
```
### Configuring Port Security

You can use the port security feature to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port. When you assign secure MAC addresses to a secure port, the port does not forward packets with source addresses outside the group of defined addresses.

This section includes information about these topics:

- Understanding Port Security, page 21-6
- Default Port Security Configuration, page 21-8
- Port Security Configuration Guidelines, page 21-8
- Enabling and Configuring Port Security, page 21-9
- Enabling and Configuring Port Security Aging, page 21-11

### Understanding Port Security

This section includes information about:

- Secure MAC Addresses, page 21-6
- Security Violations, page 21-7

### Secure MAC Addresses

You can configure these types of secure MAC addresses:

- Static secure MAC addresses—These are manually configured by using the `switchport port-security mac-address mac-address` interface configuration command, stored in the address table, and added to the switch running configuration.
- Dynamic secure MAC addresses—These are dynamically learned, stored only in the address table, and removed when the switch restarts.

---

**Resuming Normal Forwarding on a Port**

Beginning in privileged EXEC mode, follow these steps to resume normal forwarding on a port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specify the interface to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> no switchport block multicast</td>
<td>Enable unknown multicast flooding to the port.</td>
</tr>
<tr>
<td><strong>Step 4</strong> no switchport block unicast</td>
<td>Enable unknown unicast flooding to the port.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Return to privileged EXEC mode</td>
</tr>
<tr>
<td><strong>Step 6</strong> show interfaces interface-id switchport</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Sticky secure MAC addresses—These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. If these addresses are saved in the configuration file, the interface does not need to dynamically relearn them when the switch restarts. Although sticky secure addresses can be manually configured, we do not recommend it.

You can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and to add them to the running configuration by enabling sticky learning. To enable sticky learning, enter the `switchport port-security mac-address sticky` interface configuration command. When you enter this command, the interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses.

The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the sticky secure MAC addresses in the configuration file, when the switch restarts, the interface does not need to relearn these addresses. If you do not save the configuration, they are lost.

If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

A secure port can have from 1 to 132 associated secure addresses. The total number of available secure addresses on the switch is 1024.

Security Violations

It is a security violation when one of these situations occurs:

- The maximum number of secure MAC addresses have been added to the address table, and a station whose MAC address is not in the address table attempts to access the interface.
- An address learned or configured on one secure interface is seen on another secure interface in the same VLAN.

You can configure the interface for one of three violation modes, based on the action to be taken if a violation occurs:

- protect—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.
- restrict—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. In this mode, you are notified that a security violation has occurred. Specifically, an SNMP trap is sent, a syslog message is logged, and the violation counter increments.
- shutdown—in this mode, a port security violation causes the interface to immediately become error-disabled, and turns off the port LED. It also sends an SNMP trap, logs a syslog message, and increments the violation counter. When a secure port is in the error-disabled state, you can bring it out of this state by entering the `errdisable recovery cause psecure-violation` global configuration command, or you can manually re-enable it by entering the `shutdown` and `no shutdown` interface configuration commands. This is the default mode.
Table 21-1 shows the violation mode and the actions taken when you configure an interface for port security.

**Table 21-1 Security Violation Mode Actions**

<table>
<thead>
<tr>
<th>Violation Mode</th>
<th>Traffic is forwarded(^1)</th>
<th>Sends SNMP trap</th>
<th>Sends syslog message</th>
<th>Displays error message(^2)</th>
<th>Violation counter increments</th>
<th>Shuts down port</th>
</tr>
</thead>
<tbody>
<tr>
<td>protect</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>restrict</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>shutdown</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

1. Packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses.
2. The switch will return an error message if you manually configure an address that would cause a security violation.

**Default Port Security Configuration**

Table 21-2 shows the default port security configuration for an interface.

**Table 21-2 Default Port Security Configuration**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port security</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Maximum number of secure MAC addresses</td>
<td>One.</td>
</tr>
<tr>
<td>Violation mode</td>
<td>Shutdown.</td>
</tr>
<tr>
<td>Sticky address learning</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Port security aging</td>
<td>Disabled. Aging time is 0. When enabled, the default type is absolute.</td>
</tr>
</tbody>
</table>

**Port Security Configuration Guidelines**

Follow these guidelines when configuring port security:

- Port security can only be configured on static access ports.
- A secure port cannot be a dynamic access port or a trunk port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel port group.
- You cannot configure static secure or sticky secure MAC addresses on a voice VLAN.
- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the Cisco IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the phone.
- If any type of port security is enabled on the access VLAN, dynamic port security is automatically enabled on the voice VLAN.
- When a voice VLAN is configured on a secure port that is also configured as a sticky secure port, all addresses seen on the voice VLAN are learned as dynamic secure addresses, and all addresses seen on the access VLAN (to which the port belongs) are learned as sticky secure addresses.

- You cannot configure port security on a per-VLAN basis.

- The protect and restrict options cannot be simultaneously enabled on an interface.

Table 21-3 summarizes port security compatibility with other features configured on a port.

<table>
<thead>
<tr>
<th>Type of Port</th>
<th>Compatible with Port Security</th>
</tr>
</thead>
<tbody>
<tr>
<td>DTP port</td>
<td>No</td>
</tr>
<tr>
<td>Trunk port</td>
<td>No</td>
</tr>
<tr>
<td>Dynamic-access port</td>
<td>No</td>
</tr>
<tr>
<td>SPAN source port</td>
<td>Yes</td>
</tr>
<tr>
<td>SPAN destination port</td>
<td>No</td>
</tr>
<tr>
<td>EtherChannel</td>
<td>No</td>
</tr>
<tr>
<td>Protected port</td>
<td>Yes</td>
</tr>
<tr>
<td>IEEE 802.1x port</td>
<td>Yes</td>
</tr>
<tr>
<td>Voice VLAN port</td>
<td>Yes</td>
</tr>
</tbody>
</table>

1. DTP = Dynamic Trunking Protocol
2. A port configured with the `switchport mode dynamic` interface configuration command.
3. A VLAN Query Protocol (VQP) port configured with the `switchport access vlan dynamic` interface configuration command.
4. You must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN.

### Enabling and Configuring Port Security

Beginning in privileged EXEC mode, follow these steps to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code></td>
<td>Specify the interface to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>switchport mode access</code></td>
<td>Set the interface mode as <code>access</code>; an interface in the default mode (dynamic desirable) cannot be configured as a secure port.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>switchport port-security</code></td>
<td>Enable port security on the interface.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>switchport port-security maximum value</code></td>
<td>(Optional) Set the maximum number of secure MAC addresses for the interface. The range is 1 to 132; the default is 1. If an interface is configured for voice VLAN, configure a value of two secure MAC addresses.</td>
</tr>
</tbody>
</table>
To return the interface to the default condition as not a secure port, use the `no switchport port-security` interface configuration command. If you enter this command when sticky learning is enabled, the sticky secure addresses remain part of the running configuration but are removed from the address table. All addresses are now dynamically learned.

To return the interface to the default number of secure MAC addresses, use the `no switchport port-security maximum value` interface configuration command.

To return the violation mode to the default condition (shutdown mode), use the `no switchport port-security violation {protect | restrict | shutdown}` interface configuration command.

To return the interface to the default condition as not a secure port, use the `no switchport port-security` interface configuration command. If you enter this command when sticky learning is enabled, the sticky secure addresses remain part of the running configuration but are removed from the address table. All addresses are now dynamically learned.

To return the interface to the default number of secure MAC addresses, use the `no switchport port-security maximum value` interface configuration command.

To return the violation mode to the default condition (shutdown mode), use the `no switchport port-security violation {protect | restrict | shutdown}` interface configuration command.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>switchport port-security violation</td>
<td>(Optional) Set the violation mode, the action to be taken when a security violation is detected, as one of these:</td>
</tr>
<tr>
<td></td>
<td>{protect</td>
<td>restrict</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• protect—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• restrict—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. In this mode, you are notified that a security violation has occurred. Specifically, an SNMP trap is sent, a syslog message is logged, and the violation counter increments.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• shutdown—In this mode, a port security violation causes the interface to immediately become error-disabled, and turns off the port LED. It also sends an SNMP trap, logs a syslog message, and increments the violation counter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: When a secure port is in the error-disabled state, you can bring it out of this state by entering the <code>errdisable recovery cause psecure-violation</code> global configuration command, or you can manually re-enable it by entering the <code>shutdown</code> and <code>no shutdown</code> interface configuration commands.</td>
</tr>
<tr>
<td>7</td>
<td>switchport port-security mac-address</td>
<td>(Optional) Enter a static secure MAC address for the interface, repeating the command as many times as necessary. You can use this command to enter the maximum number of secure MAC addresses. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned.</td>
</tr>
<tr>
<td></td>
<td>mac-address</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: If you enable sticky learning after you enter this command, the secure addresses that were dynamically learned are converted to sticky secure MAC addresses and are added to the running configuration.</td>
</tr>
<tr>
<td>8</td>
<td>switchport port-security mac-address</td>
<td>(Optional) Enable sticky learning on the interface.</td>
</tr>
<tr>
<td></td>
<td>sticky</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>10</td>
<td>show port-security</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>11</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To disable sticky learning on an interface, use the `no switchport port-security mac-address sticky` interface configuration command. The interface converts the sticky secure MAC addresses to dynamic secure addresses.

To delete a static secure MAC address from the address table, use the `clear port-security configured address mac-address` privileged EXEC command. To delete all the static secure MAC addresses on an interface, use the `clear port-security configured interface interface-id` privileged EXEC command.

To delete a dynamic secure MAC address from the address table, use the `clear port-security dynamic address mac-address` privileged EXEC command. To delete all the dynamic addresses on an interface, use the `clear port-security dynamic interface interface-id` privileged EXEC command.

To delete a sticky secure MAC addresses from the address table, use the `clear port-security sticky address mac-address` privileged EXEC command. To delete all the sticky addresses on an interface, use the `clear port-security sticky interface interface-id` privileged EXEC command.

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 50. The violation mode is the default, no static secure MAC addresses are configured, and sticky learning is enabled.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet0/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 50
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# end
```

This example shows how to configure a static secure MAC address on a port and enable sticky learning:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet0/2
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address 0000.02000.0004
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# end
```

### Enabling and Configuring Port Security Aging

You can use port security aging to set the aging time for static and dynamic secure addresses on a port. Two types of aging are supported per port:

- **Absolute**—The secure addresses on the port are deleted after the specified aging time.
- **Inactivity**—The secure addresses on the port are deleted only if the secure addresses are inactive for the specified aging time.

Use this feature to remove and add PCs on a secure port without manually deleting the existing secure MAC addresses and to still limit the number of secure addresses on a port. You can enable or disable the aging of statically configured secure addresses on a per-port basis.
Beginning in privileged EXEC mode, follow these steps to configure port security aging:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the port on which you want to enable port security aging, and enter interface configuration mode. Note The switch does not support port security aging of sticky secure addresses.</td>
</tr>
<tr>
<td>Step 3 switchport port-security aging time type {absolute</td>
<td>time</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show port-security [interface interface-id] [address]</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable port security aging for all secure addresses on a port, use the no switchport port-security aging time interface configuration command. To disable aging for only statically configured secure addresses, use the no switchport port-security aging static interface configuration command.

This example shows how to set the aging time as 2 hours for the secure addresses on a port:

```
Switch(config)# interface fastethernet0/1
Switch(config-if)# switchport port-security aging time 120
```

This example shows how to set the aging time as 2 minutes for the inactivity aging type with aging enabled for the configured secure addresses on the interface:

```
Switch(config-if)# switchport port-security aging time 2
Switch(config-if)# switchport port-security aging type inactivity
Switch(config-if)# switchport port-security aging static
```

You can verify the previous commands by entering the show port-security interface interface-id privileged EXEC command.
Displaying Port-Based Traffic Control Settings

The `show interfaces interface-id switchport` privileged EXEC command displays (among other characteristics) the interface traffic suppression and control configuration. The `show storm-control` and `show port-security` privileged EXEC commands display those features.

To display traffic control information, use one or more of the privileged EXEC commands in Table 21-4.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces [interface-id] switchport</code></td>
<td>Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.</td>
</tr>
<tr>
<td>`show storm-control [interface-id] [broadcast</td>
<td>multicast</td>
</tr>
<tr>
<td><code>show port-security [interface interface-id]</code></td>
<td>Displays port security settings for the switch or for the specified interface, including the maximum allowed number of secure MAC addresses for each interface, the number of secure MAC addresses on the interface, the number of security violations that have occurred, and the violation mode.</td>
</tr>
<tr>
<td><code>show port-security [interface interface-id] address</code></td>
<td>Displays all secure MAC addresses configured on all switch interfaces or on a specified interface with aging information for each address.</td>
</tr>
</tbody>
</table>
Configuring DHCP Features

This chapter describes how to configure DHCP snooping and the option-82 data insertion features on the Catalyst 2950 or Catalyst 2955 switch.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release, and see the “IP Addressing and Services” section in the Cisco IOS IP and IP Routing Command Reference, Release 12.1.

This chapter consists of these sections:
- Understanding DHCP Features, page 19-1
- Configuring DHCP Features, page 19-5
- Displaying DHCP Information, page 19-8

Understanding DHCP Features

DHCP is widely used in LAN environments to dynamically assign host IP addresses from a centralized server, which significantly reduces the overhead of administration of IP addresses. DHCP also helps conserve the limited IP address space because IP addresses no longer need to be permanently assigned to hosts; only those hosts that are connected to the network consume IP addresses.

The switch supports these DHCP features:
- DHCP Server, page 19-2
- DHCP Relay Agent, page 19-2
- DHCP Snooping, page 19-2
- Option-82 Data Insertion, page 19-3

For information about the DHCP client, see the “IP Addressing and Services” section in the Cisco IOS IP and IP Routing Configuration Guide, Release 12.1.
DHCP Server

The DHCP server assigns IP addresses from specified address pools on a switch or router to DHCP clients and manages them. If the DHCP server cannot give the DHCP client the requested configuration parameters from its database, it forwards the request to one or more secondary DHCP servers defined by the network administrator.

Note
The DHCP server feature is only available on Catalyst 2955 switches.

DHCP Relay Agent

A DHCP relay agent is a Layer 3 device that forwards DHCP packets between clients and servers. Relay agents forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is different from the normal Layer 2 forwarding, in which IP datagrams are switched transparently between networks. Relay agents receive DHCP messages and generate new DHCP messages to send on egress interfaces.

DHCP Snooping

DHCP snooping is a DHCP security feature that provides network security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding database, which is also referred to as a DHCP snooping binding table.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. You can use DHCP snooping to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

Note
For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces.

An untrusted message is a message that is received from outside the network or firewall. When you use DHCP snooping in a service-provider environment, an untrusted message is sent from a device that is not in the service-provider network, such as a customer’s switch. Messages from unknown devices are untrusted because they can be sources of traffic attacks.

The DHCP snooping binding database contains the MAC address, the IP address, the lease time, the binding type, the VLAN number, and the interface information that corresponds to the local untrusted interfaces of a switch. It does not contain information regarding hosts interconnected with a trusted interface.

In a service-provider network, a trusted interface is connected to a port on a device in the same network. An untrusted interface is connected to an untrusted interface in the network or to an interface on a device that is not in the network.

When a switch receives a packet on an untrusted interface and the interface belongs to a VLAN in which DHCP snooping is enabled, the switch compares the source MAC address and the DHCP client hardware address. If addresses match (the default), the switch forwards the packet. If the addresses do not match, the switch drops the packet.
The switch drops a DHCP packet when one of these situations occurs:

- A packet from a DHCP server, such as a DHCPOFFER, DHCPACK, DHCPNAK, or DHCPLEASEQUERY packet, is received from outside the network or firewall.
- A packet is received on an untrusted interface, and the source MAC address and the DHCP client hardware address do not match.
- The switch receives a DHCPRELEASE or DHCPDECLINE broadcast message that contains a MAC address in the DHCP snooping binding table, but the interface information in the binding table does not match the interface on which the message was received.
- A DHCP relay agent forwards a DHCP packet that includes a relay-agent IP address that is not 0.0.0.0, or the relay agent forwards a packet that includes option-82 information to an untrusted port.

If the switch is an aggregation switch supporting DHCP snooping and is connected to an edge switch that is inserting DHCP option-82 information, the switch drops packets with option-82 information when packets are received on an untrusted interface. If DHCP snooping is enabled and packets are received on a trusted port, the aggregation switch does not learn the DHCP snooping bindings for connected devices and cannot build a complete DHCP snooping binding database.

When option-82 information is inserted by an edge switch in software releases earlier than Cisco IOS Release 12.1(22)EA3, you cannot configure DHCP snooping on an aggregation switch because the DHCP snooping bindings database is not properly populated. You also cannot configure IP source guard and dynamic Address Resolution Protocol (ARP) inspection on the switch unless you use static bindings or ARP access control lists (ACLs).

In Cisco IOS Release 12.1(22)EA3 when an aggregation switch can be connected to an edge switch through an untrusted interface and you enter the `ip dhcp snooping information option allow-untrusted` global configuration command, the aggregation switch accepts packets with option-82 information from the edge switch. The aggregation switch learns the bindings for hosts connected through an untrusted switch interface. The DHCP security features, such as dynamic ARP or IP source guard, can still be enabled on the aggregation switch while the switch receives packets with option-82 information on ingress untrusted interfaces to which hosts are connected. The port on the edge switch that connects to the aggregation switch must be configured as a trusted interface.

**Option-82 Data Insertion**

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP option-82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

**Note**
The DHCP option-82 feature is supported only when DHCP snooping is enabled globally and on the VLANs to which subscriber devices using this feature are assigned. The switch also supports the DHCP option-82 feature when DHCP is disabled.

Figure 19-1 is an example of a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Catalyst switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.
When you enable the DHCP snooping information option 82 on the switch, this sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
- When the switch receives the DHCP request, it adds the option-82 information in the packet. The option-82 information contains the switch MAC address (the remote-ID suboption) and the port identifier, `vlan-mod-port`, from which the packet is received (the circuit-ID suboption).
- If the IP address of the relay agent is configured, the switch adds the IP address in the DHCP packet.
- The switch forwards the DHCP request that includes the option-82 field to the DHCP server.
- The DHCP server receives the packet. If the server is option-82 capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.
- The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. When the client and server are on the same subnet, the server broadcasts the reply. The switch verifies that it originally inserted the option-82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.

When the described sequence of events occurs, the values in these fields in Figure 19-2 do not change:

- Circuit-ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Circuit-ID type
  - Length of the circuit-ID type
- Remote-ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Remote-ID type
  - Length of the remote-ID type
The port numbers in the port field of the circuit-ID suboption start at 0. For example, on a Catalyst 2950G-24-EI switch, port 0 is the Fast Ethernet 0/1 port, port 1 is the Fast Ethernet 0/2 port, port 2 is the Fast Ethernet 0/3 port, and so on. Port 24 is the Gigabit Interface Converter (GBIC)-based Gigabit module slot 0/1, and port 25 is the GBIC-based Gigabit module slot 0/2.

Figure 19-2 shows the packet formats for the remote ID suboption and the circuit ID suboption. The switch uses the packet formats when DHCP snooping is globally enabled and when the `ip dhcp snooping information option` global configuration command is entered. For the circuit ID suboption, the module field is always zero.

### Configuring DHCP Features

These sections describe how to configure DHCP snooping and option 82 on your switch:

- Default DHCP Configuration, page 19-5
- DHCP Snooping Configuration Guidelines, page 19-6
- Configuring the DHCP Server, page 19-7
- Enabling DHCP Snooping and Option 82, page 19-7

### Default DHCP Configuration

Table 19-1 shows the default DHCP configuration.
Chapter 19  Configuring DHCP Features

Configuring DHCP Features

DHCP Snooping Configuration Guidelines

These are the configuration guidelines for DHCP snooping.

- You must globally enable DHCP snooping on the switch.
- DHCP snooping is not active until DHCP snooping is enabled on a VLAN.
- Before globally enabling DHCP snooping on the switch, make sure that the devices acting as the DHCP server and the DHCP relay agent are configured and enabled.
- Before configuring the DHCP snooping information option on your switch, be sure to configure the device that is acting as the DHCP server. For example, you must specify the IP addresses that the DHCP server can assign or exclude, or you must configure DHCP options for these devices.
- If the DHCP relay agent is enabled but DHCP snooping is disabled, the DHCP option-82 data insertion feature is not supported.
- If a switch port is connected to a DHCP server, configure a port as trusted by entering the `ip dhcp snooping trust` interface configuration command.
- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the `no ip dhcp snooping trust` interface configuration command.
- Do not enter the `ip dhcp snooping information option allow-untrusted` command on an aggregation switch to which an untrusted device is connected. If you enter this command, an untrusted device might spoof the option-82 information.
Configuring the DHCP Server

The Catalyst 2955 switch can act as a DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your switch but are not configured. These features are not operational.

For procedures to configure the switch as a DHCP server, see the “Configuring DHCP” section of the “IP addressing and Services” section of the Cisco IOS IP and IP Routing Configuration Guide, Release 12.1

Enabling DHCP Snooping and Option 82

Beginning in privileged EXEC mode, follow these steps to enable DHCP snooping on the switch.

<table>
<thead>
<tr>

<td>ip dhcp snooping limit rate rate</td>
</tr>
<tr>
<td>Note</td>
<td>We recommend an untrusted rate limit of not more than 100 packets per second. If you configure rate limiting for trusted interfaces, you might need to increase the rate limit if the port is a trunk port assigned to more than one VLAN on which DHCP snooping is enabled.</td>
</tr>
<tr>
<td>Step 9</td>
<td>exit</td>
</tr>
</tbody>
</table>
Chapter 19 Configuring DHCP Features

### Displaying DHCP Information

To display the DHCP snooping information, use one or more of the privileged EXEC commands in Table 19-2:

**Table 19-2 Commands for Displaying DHCP Information**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip dhcp snooping</td>
<td>Displays the DHCP snooping configuration for a switch.</td>
</tr>
<tr>
<td>show ip dhcp snooping binding</td>
<td>Displays only the dynamically configured bindings in the DHCP snooping binding database.</td>
</tr>
</tbody>
</table>

1. If DHCP snooping is enabled and an interface changes to the down state, the switch does not delete the manually configured bindings.
Configuring IGMP Snooping and MVR

This chapter describes how to configure Internet Group Management Protocol (IGMP) snooping on your Catalyst 2950 or Catalyst 2955, including an application of local IGMP snooping, Multicast VLAN Registration (MVR). It also includes procedures for controlling multicast group membership by using IGMP filtering and procedures for configuring the IGMP throttling action.

Note

For complete syntax and usage information for the commands used in this chapter, see the switch command reference for this release and the

This chapter consists of these sections:

- Understanding IGMP Snooping, page 20-1
- Configuring IGMP Snooping, page 20-6
- Displaying IGMP Snooping Information, page 20-13
- Understanding Multicast VLAN Registration, page 20-14
- Configuring MVR, page 20-17
- Displaying MVR Information, page 20-20
- Configuring IGMP Filtering and Throttling, page 20-21
- Displaying IGMP Filtering and Throttling Configuration, page 20-25

Note

For MAC addresses that map to IP multicast groups, you can either manage them through features such as IGMP snooping and MVR, or you can use static MAC addresses. However, you cannot use both methods simultaneously. Therefore, before using IGMP snooping or MVR, you should remove all statically configured MAC addresses that map to IP multicast groups.

Understanding IGMP Snooping

Layer 2 switches can use IGMP snooping to constrain the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. As the name implies, IGMP snooping requires the LAN switch to snoop on the IGMP transmissions between the host and the router and to keep track of multicast groups and member ports. When the switch receives an IGMP report from a host for a particular multicast group,
the switch adds the host port number to the forwarding table entry; when it receives an IGMP Leave Group message from a host, it removes the host port from the table entry. It also periodically deletes entries if it does not receive IGMP membership reports from the multicast clients.

**Note**
For more information on IP multicast and IGMP, see RFC 1112 and RFC 2236.

The multicast router sends out periodic IGMP general queries to all VLANs. When IGMP snooping is enabled, the switch responds to the router queries with only one join request per MAC multicast group, and the switch creates one entry per VLAN in the Layer 2 forwarding table for each MAC group from which it receives an IGMP join request. All hosts interested in this multicast traffic send join requests and are added to the forwarding table entry.

Layer 2 multicast groups learned through IGMP snooping are dynamic. However, you can statically configure MAC multicast groups by using the `ip igmp snooping vlan static` global configuration command. If you specify group membership for a multicast group address statically, your setting supersedes any automatic manipulation by IGMP snooping. Multicast group membership lists can consist of both user-defined and IGMP snooping-learned settings.

If a port spanning-tree, a port group, or a VLAN ID change occurs, the IGMP snooping-learned multicast groups from this port on the VLAN are deleted.

These sections describe characteristics of IGMP snooping on the switch:

- IGMP Versions, page 20-2
- Joining a Multicast Group, page 20-3
- Leaving a Multicast Group, page 20-4
- Immediate-Leave Processing, page 20-5
- IGMP Configurable-Leave Timer, page 20-5
- IGMP Report Suppression, page 20-5
- Source-Only Networks, page 20-6

**IGMP Versions**

The switch supports IGMP version 1, IGMP version 2, and IGMP version 3. These versions are interoperable on the switch. For example, if IGMP snooping is enabled on an IGMPv2 switch and the switch receives an IGMPv3 report from a host, the switch can forward the IGMPv3 report to the multicast router.

**Note**
The switch supports IGMPv3 snooping based only on the destination multicast MAC address. It does not support snooping based on the source MAC address or on proxy reports.

An IGMPv3 switch supports Basic IGMPv3 Snooping Support (BISS), which includes support for the snooping features on IGMPv1 and IGMPv2 switches and for IGMPv3 membership report messages. BISS constrains the flooding of multicast traffic when your network includes IGMPv3 hosts. It constrains traffic to approximately the same set of ports as the IGMP snooping feature on IGMPv2 or IGMPv1 hosts.

**Note**
IGMPv3 join and leave messages are not supported on switches running IGMP filtering or MVR.
An IGMPv3 switch can receive messages from and forward messages to a device running the Source Specific Multicast (SSM) feature. For more information, see the “Configuring IP Multicast Layer 3 Switching” chapter in the Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide, Cisco IOS Release 12.1(12c)EW at this URL: http://www.cisco.com/en/US/docs/switches/lan/catalyst4500/12.1/12ew/configuration/guide/mcastmls.html

Joining a Multicast Group

When a host connected to the switch wants to join an IP multicast group, it sends an unsolicited IGMP join message, specifying the IP multicast group to join. Alternatively, when the switch receives a general query from the router, it forwards the query to all ports in the VLAN. Hosts wanting to join the multicast group respond by sending a join message to the switch. The switch CPU creates a multicast forwarding-table entry for the group if it is not already present. The CPU also adds the interface where the join message was received to the forwarding-table entry. The host associated with that interface receives multicast traffic for that multicast group. See Figure 20-1.

Figure 20-1  Initial IGMP Join Message

![Figure 20-1 Initial IGMP Join Message](image)

Router A sends a general query to the switch, which forwards the query to ports 2 through 5, all members of the same VLAN. Host 1 wants to join multicast group 224.1.2.3 and multicasts an IGMP membership report (IGMP join message) to the group with the equivalent MAC destination address of 0x0100.5E01.0203. When the CPU receives the IGMP report multicast by Host 1, the CPU uses the information in the IGMP report to set up a forwarding-table entry, as shown in Table 20-1, that includes the port numbers of Host 1, the router, and the switch internal CPU.

Table 20-1  IGMP Snooping Forwarding Table

<table>
<thead>
<tr>
<th>Destination Address</th>
<th>Type of Packet</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>0100.5eXX.XXXX</td>
<td>IGMP</td>
<td>0</td>
</tr>
<tr>
<td>0100.5e01.0203</td>
<td>IGMP</td>
<td>1, 2</td>
</tr>
</tbody>
</table>
Note that the switch hardware can distinguish IGMP information packets from other packets for the multicast group.

- The first entry in the table tells the switching engine to send IGMP packets to only the switch CPU. This prevents the CPU from becoming overloaded with multicast frames.
- The second entry tells the switching engine to send frames addressed to the 0x0100.5e01.0203 multicast MAC address that are not IGMP packets (!IGMP) to the router and to the host that has joined the group.

If another host (for example, Host 4) sends an unsolicited IGMP join message for the same group (Figure 20-2), the CPU receives that message and adds the port number of Host 4 to the forwarding table as shown in Table 20-2. Note that because the forwarding table directs IGMP messages only to the CPU, the message is not flooded to other ports on the switch. Any known multicast traffic is forwarded to the group and not to the CPU. Any unknown multicast traffic is flooded to the VLAN and sent to the CPU until it becomes known.

![Figure 20-2 Second Host Joining a Multicast Group](image)

<td>IGMP</td>
<td>0</td>
</tr>
<tr>
<td>0100.5e01.0203</td>
<td>!IGMP</td>
<td>1, 2, 5</td>
</tr>
</tbody>
</table>

**Leaving a Multicast Group**

The router sends periodic multicast general queries and the switch forwards these queries through all ports in the VLAN. Interested hosts respond to the queries. If at least one host in the VLAN wishes to receive multicast traffic, the router continues forwarding the multicast traffic to the VLAN. The switch forwards multicast group traffic to only those hosts listed in the forwarding table for that Layer 2 multicast group.
When hosts want to leave a multicast group, they can either silently leave, or they can send a leave message. When the switch receives a leave message from a host, it sends a group-specific query to determine if any other devices connected to that interface are interested in traffic for the specific multicast group. The switch then updates the forwarding table for that MAC group so that only those hosts interested in receiving multicast traffic for the group are listed in the forwarding table. If the router receives no reports from a VLAN, it removes the group for the VLAN from its IGMP cache.

**Immediate-Leave Processing**

Immediate Leave is only supported with IGMP version 2 hosts.

The switch uses IGMP snooping Immediate-Leave processing to remove from the forwarding table an interface that sends a leave message without the switch sending group-specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Immediate-Leave processing ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are simultaneously in use.

**Note**

You should only use the Immediate-Leave processing feature on VLANs where a single host is connected to each port. If Immediate Leave is enabled in VLANs where more than one host is connected to a port, some hosts might inadvertently be dropped.

**IGMP Configurable-Leave Timer**

In Cisco IOS Release and earlier, the IGMP snooping leave time was fixed at 5 seconds. If membership reports were not received by the switch before the query response time of the query expired, a port was removed from the multicast group membership. However, some applications require a leave latency of less than 5 seconds.

In Cisco IOS Release and later, you can configure the time that the switch waits after sending a group-specific query to determine if hosts are still interested in a specific multicast group. The IGMP leave response time can be configured from 100 to 5000 milliseconds. The timer can be set either globally or on a per-VLAN basis. The VLAN configuration of the leave time overrides the global configuration.

**IGMP Report Suppression**

**Note**

IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

The switch uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP router suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the switch forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers.
If the multicast router query also includes requests for IGMPv3 reports, the switch forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression, all IGMP reports are forwarded to the multicast routers.

### Source-Only Networks

In a source-only network, switch ports are connected to multicast source ports and multicast router ports. The switch ports are not connected to hosts that send IGMP join or leave messages.

The switch learns about IP multicast groups from the IP multicast data stream by using the source-only learning method. The switch forwards traffic only to the multicast router ports.

The default learning method is IP multicast-source-only learning. You can disable IP multicast-source-only learning by using the `no ip igmp snooping source-only-learning` global configuration command.

In addition to IGMP query packets, the switch also uses Protocol-Independent Multicast protocol version 2 (PIMv2) packets for multicast router discovery. The packets are sent to the switch CPU, which can result in a occasional high CPU traffic. You can disable multicast router discovery by PIMv2 packets by using the `no ip igmp snooping mrouter learn pim v2` global configuration command. This command only works when you also disable source-only learning on the switch by using the `no ip igmp snooping source-only-learning` global configuration command.

By default, the switch ages out forwarding-table entries that were learned by the source-only learning method and that are not in use. If the aging time is too long or is disabled, the forwarding table is filled with unused entries that the switch learned by using source-only learning or by using the IGMP join messages. When the switch receives traffic for new IP multicast groups, it floods the packet to all ports in the same VLAN. This unnecessary flooding can impact switch performance.

If aging is disabled and you want to delete multicast addresses that the switch learned by using source-only learning, re-enable aging of the forwarding-table entries. The switch can now age out the multicast addresses that were learned by the source-only learning method and are not in use.

### Configuring IGMP Snooping

IGMP snooping allows switches to examine IGMP packets and make forwarding decisions based on their content.

These sections describe how to configure IGMP snooping:

- Default IGMP Snooping Configuration, page 20-7
- Enabling or Disabling IGMP Snooping, page 20-7
- Setting the Snooping Method, page 20-8
- Configuring a Multicast Router Port, page 20-9
- Configuring a Host Statically to Join a Group, page 20-9
- Enabling IGMP Immediate-Leave Processing, page 20-10
- Configuring the IGMP Leave Timer, page 20-10
- Disabling IGMP Report Suppression, page 20-11
- Disabling IP Multicast-Source-Only Learning, page 20-12
Default IGMP Snooping Configuration

Table 20-3 shows the default IGMP snooping configuration.

Table 20-3 Default IGMP Snooping Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGMP snooping</td>
<td>Enabled globally and per VLAN.</td>
</tr>
<tr>
<td>Multicast routers</td>
<td>None configured.</td>
</tr>
<tr>
<td>Multicast router learning (snooping) method</td>
<td>PIM-DVMRP.</td>
</tr>
<tr>
<td>IGMP snooping Immediate Leave</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Static groups</td>
<td>None configured.</td>
</tr>
<tr>
<td>Aging forward-table entries</td>
<td>Enabled. The default is 600 seconds</td>
</tr>
<tr>
<td></td>
<td>(10 minutes).</td>
</tr>
<tr>
<td>IGMP report suppression</td>
<td>Enabled.</td>
</tr>
</tbody>
</table>

Enabling or Disabling IGMP Snooping

By default, IGMP snooping is globally enabled on the switch. When globally enabled or disabled, it is also enabled or disabled in all existing VLAN interfaces. IGMP snooping is by default enabled on all VLANs, but can be enabled and disabled on a per-VLAN basis.

Global IGMP snooping overrides the VLAN IGMP snooping. If global snooping is disabled, you cannot enable VLAN snooping. If global snooping is enabled, you can enable or disable VLAN snooping.

Beginning in privileged EXEC mode, follow these steps to globally enable IGMP snooping on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip igmp snooping</td>
<td>Globally enable IGMP snooping in all existing VLAN interfaces.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To globally disable IGMP snooping on all VLAN interfaces, use the no ip igmp snooping global configuration command.

Beginning in privileged EXEC mode, follow these steps to enable IGMP snooping on a VLAN interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip igmp snooping vlan vlan-id</td>
<td>Enable IGMP snooping on the VLAN interface.</td>
</tr>
</tbody>
</table>
Configuring IGMP Snooping

To disable IGMP snooping on a VLAN interface, use the `no ip igmp snooping vlan vlan-id` global configuration command for the specified VLAN number.

Setting the Snooping Method

Multicast-capable router ports are added to the forwarding table for every Layer 2 multicast entry. The switch learns of such ports through one of these methods:

- Snooping on IGMP queries, Protocol Independent Multicast (PIM) packets, and Distance Vector Multicast Routing Protocol (DVMRP) packets
- Listening to Cisco Group Management Protocol (CGMP) packets from other routers
- Statically connecting to a multicast router port with the `ip igmp snooping mrouter` global configuration command

You can configure the switch either to snoop on IGMP queries and PIM/DVMRP packets or to listen to CGMP self-join or proxy-join packets. By default, the switch snoops on PIM/DVMRP packets on all VLANs. To learn of multicast router ports through only CGMP packets, use the `ip igmp snooping vlan vlan-id mrouter learn cgmp` global configuration command. When this command is entered, the router listens to only CGMP self-join and CGMP proxy-join packets and no other CGMP packets. To learn of multicast router ports through only PIM-DVMRP packets, use the `ip igmp snooping vlan vlan-id mrouter learn pim-dvmrp` global configuration command.

Beginning in privileged EXEC mode, follow these steps to alter the method in which a VLAN interface dynamically accesses a multicast router:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>`ip igmp snooping vlan vlan-id mrouter learn {cgmp</td>
</tr>
<tr>
<td></td>
<td><code>cgmp</code>—Listen for CGMP packets. This method is useful for reducing control traffic.</td>
</tr>
<tr>
<td></td>
<td><code>pim-dvmrp</code>—Snoop on IGMP queries and PIM-DVMRP packets. This is the default.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show ip igmp snooping</code> Verify the configuration.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to configure IGMP snooping to use CGMP packets as the learning method:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 1 mrouter learn cgmp
Switch(config)# end
```
To return to the default learning method, use the `no ip igmp snooping vlan vlan-id mrouter learn cgmp` global configuration command.

**Configuring a Multicast Router Port**

To add a multicast router port (add a static connection to a multicast router), use the `ip igmp snooping vlan mrouter` global configuration command on the switch.

Beginning in privileged EXEC mode, follow these steps to enable a static connection to a multicast router:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>ip igmp snooping vlan vlan-id mrouter interface interface-id</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show ip igmp snooping mrouter [vlan vlan-id]</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code> (Optional)</td>
</tr>
</tbody>
</table>

To remove a multicast router port from the VLAN, use the `no ip igmp snooping vlan vlan-id mrouter interface interface-id` global configuration command.

This example shows how to enable a static connection to a multicast router and verify the configuration:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 200 mrouter interface gigabitethernet0/1
Switch(config)# end
```

**Configuring a Host Statically to Join a Group**

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure a host on an interface.

Beginning in privileged EXEC mode, follow these steps to add a Layer 2 port as a member of a multicast group:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>ip igmp snooping vlan vlan-id static mac-address interface interface-id</code></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code></td>
</tr>
</tbody>
</table>
Chapter 20      Configuring IGMP Snooping and MVR

Configuring IGMP Snooping

To remove the Layer 2 port from the multicast group, use the `no ip igmp snooping vlan vlan-id static mac-address interface interface-id` global configuration command.

This example shows how to statically configure a host on an interface and verify the configuration:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 1 static 0100.5e00.0203 interface gigabitethernet0/1
Switch(config)# end
```

Enabling IGMP Immediate-Leave Processing

When you enable IGMP Immediate-Leave processing, the switch immediately removes a port when it detects an IGMP version 2 leave message on that port. You should use the Immediate-Leave feature only when there is a single receiver present on every port in the VLAN.

**Note**

Immediate Leave is supported with only IGMP version 2 hosts.

Beginning in privileged EXEC mode, follow these steps to enable IGMP Immediate-Leave processing:

```
Step 1  configure terminal
Step 2  ip igmp snooping vlan vlan-id immediate-leave
Step 3  end
Step 4  show ip igmp snooping vlan vlan-id
Step 5  copy running-config startup-config
```

To disable IGMP Immediate-Leave on a VLAN, use the `no ip igmp snooping vlan vlan-id immediate-leave` global configuration command.

This example shows how to enable IGMP immediate-leave processing on VLAN 130:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 130 immediate-leave
Switch(config)# end
```

Configuring the IGMP Leave Timer

Follows these guidelines when configuring the IGMP leave timer:

- You can configure the leave time globally or on a per-VLAN basis.
- Configuring the leave time on a VLAN overrides the global setting.
Chapter 20  Configuring IGMP Snooping and MVR

Configuring IGMP Snooping

- The default leave time is 1000 milliseconds.
- The IGMP configurable leave time is only supported on hosts running IGMP Version 2.
- The actual leave latency in the network is usually the configured leave time. However, the leave time might vary around the configured time, depending on real-time CPU load conditions, network delays and the amount of traffic sent through the interface.

Beginning in privileged EXEC mode, follow these steps to enable the IGMP configurable-leave timer:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip igmp snooping last-member-query-interval time</td>
</tr>
<tr>
<td>Step 3</td>
<td>ip igmp snooping vlan vlan-id last-member-query-interval time</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show ip igmp snooping</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the `no ip igmp snooping last-member-query-interval` global configuration command to globally reset the IGMP leave timer to the default setting (1000 milliseconds).

Use the `no ip igmp snooping vlan vlan-id last-member-query-interval global configuration` command to remove the configured IGMP leave-time setting from the specified VLAN.

Disabling IGMP Report Suppression

IGMP report suppression is enabled by default. When it is enabled, the switch forwards only one IGMP report per multicast router query. When report suppression is disabled, all IGMP reports are forwarded to the multicast routers.

**Note**

IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

Beginning in privileged EXEC mode, follow these steps to disable IGMP report suppression:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>no ip igmp snooping report-suppression</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show ip igmp snooping</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
To re-enable IGMP report suppression, use the `ip igmp snooping report-suppression` global configuration command.

### Disabling IP Multicast-Source-Only Learning

The IP multicast-source-only learning method is enabled by default. The switch learns the IP multicast group from the IP multicast data stream and only forwards traffic to the multicast router ports.

If IP multicast-source-only learning is disabled by using the `no ip igmp snooping source-only-learning` global configuration command, the switch floods unknown multicast traffic to the VLAN and sends the traffic to the CPU until the traffic becomes known. When the switch receives an IGMP report from a host for a particular multicast group, the switch forwards traffic from this multicast group only to the multicast router ports.

To disable multicast router discovery by PIMv2 packets, you should also enter the `no ip igmp snooping mrouter learn pim v2` global configuration command.

**Note**

We strongly recommend that you do not disable IP multicast-source-only learning. IP multicast-source-only learning should be disabled only if your network is not composed of IP multicast-source-only networks and if disabling this learning method improves the network performance.

Beginning in privileged EXEC mode, follow these steps to disable IP multicast-source-only learning:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>no ip igmp snooping source-only-learning</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>no ip igmp snooping mrouter learn pim v2</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code></td>
</tr>
<tr>
<td>Step 5</td>
<td>`show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

To enable IP multicast-source-only learning, use the `ip igmp snooping source-only-learning` global configuration command. To enable PIM v2 multicast router discovery, use the `p igmp snooping mrouter learn pim v2` global configuration command.

This example shows how to disable IP multicast-source-only learning and PIM v2 multicast router discovery:

```
Switch# configure terminal
Switch(config)# no ip igmp snooping source-only-learning
Switch(config)# no ip igmp snooping mrouter learn pim v2
Switch(config)# end
```
You can set the aging time for forwarding-table entries that the switch learns by using the IP multicast-source-only learning method.

Beginning in privileged EXEC mode, follow these steps to configure the aging time:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>ip igmp snooping source-only learning age-timer time</td>
<td>Set the aging time. The range is 0 to 2880 seconds. The default is 600 seconds (10 minutes).</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
<td>Verify the aging time.</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable the aging of the forwarding table entries, enter the `ip igmp snooping source-only-learning age-timer 0` global configuration command.

If you disable source-only learning by using the `no ip igmp snooping source-only learning` global configuration command and the aging time is enabled, it has no effect on the switch.

You can display IGMP snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display MAC address multicast entries for a VLAN configured for IGMP snooping.

To display IGMP snooping information, use one or more of the privileged EXEC commands in Table 20-4.
Understanding Multicast VLAN Registration

Multicast VLAN Registration (MVR) is designed for applications using wide-scale deployment of multicast traffic across an Ethernet ring-based service provider network (for example, the broadcast of multiple television channels over a service-provider network). MVR allows a subscriber on a port to subscribe and unsubscribe to a multicast stream on the network-wide multicast VLAN. It allows the single multicast VLAN to be shared in the network while subscribers remain in separate VLANs. MVR provides the ability to continuously send multicast streams in the multicast VLAN, but to isolate the streams from the subscriber VLANs for bandwidth and security reasons.

MVR assumes that subscriber ports subscribe and unsubscribe (join and leave) these multicast streams by sending out IGMP join and leave messages. These messages can originate from an IGMP version-2-compatible host with an Ethernet connection. Although MVR operates on the underlying mechanism of IGMP snooping, the two features operate independently of each other. One can be enabled or disabled without affecting the behavior of the other feature. However, if IGMP snooping and MVR are both enabled, MVR reacts only to join and leave messages from multicast groups configured under MVR. Join and leave messages from all other multicast groups are managed by IGMP snooping.

**Table 20-4 Commands for Displaying IGMP Snooping Information**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip igmp snooping [vlan vlan-id]</td>
<td>Display the snooping configuration information for all VLANs on the switch or for a specified VLAN. (Optional) Enter vlan vlan-id to display information for a single VLAN.</td>
</tr>
<tr>
<td>show ip igmp snooping group [vlan vlan-id]</td>
<td>Display information about the IGMP multicast groups, the compatibility mode, and the ports that are associated with each group. (Optional) Enter vlan vlan-id to display information for a single VLAN.</td>
</tr>
<tr>
<td>show ip igmp snooping mrouter [vlan vlan-id]</td>
<td>Display information on dynamically learned and manually configured multicast router interfaces. <em>Note</em> When you enable IGMP snooping, the switch automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces. (Optional) Enter vlan vlan-id to display information for a single VLAN.</td>
</tr>
</tbody>
</table>
| show mac address-table multicast [vlan vlan-id] [user | igmp-snooping] [count] | Display the Layer 2 MAC address table entries for a VLAN. The keywords are all optional and limit the display as shown:
  - *vlan vlan-id*—Displays only the specified multicast group VLAN.
  - *user*—Displays only the user-configured multicast entries.
  - *igmp-snooping*—Displays only entries learned through IGMP snooping.
  - *count*—Displays only the total number of entries for the selected criteria, not the actual entries. |

For more information about the keywords and options in these commands, see the command reference for this release.

For examples of output from the commands in Table 20-4, see the command reference for this release.
Chapter 20 Configuring IGMP Snooping and MVR

Understanding Multicast VLAN Registration

The switch CPU identifies the MVR IP multicast streams and their associated MAC addresses in the switch forwarding table, intercepts the IGMP messages, and modifies the forwarding table to include or remove the subscriber as a receiver of the multicast stream, even though the receivers might be in a different VLAN from the source. This forwarding behavior selectively allows traffic to cross between different VLANs.

The switch has these modes of MVR operation: dynamic and compatible.

- When operating in MVR dynamic mode, the switch performs standard IGMP snooping. IGMP information packets are sent to the switch CPU, but multicast data packets are not sent to the CPU. Dynamic mode allows the multicast router to run normally because the switch sends the IGMP join messages to the router, and the router forwards multicast streams for a particular group to an interface only if it has received a join message from the interface for the group. Receiver ports are treated as members of the multicast VLAN for MVR multicast control and data traffic. IGMP reports for MVR groups are sent out source ports in the multicast VLAN.

- When in MVR compatible mode, 2950 or Catalyst 2955 works the same as dynamic mode for all multicast data packets and IGMP query and leave packets. However, received IGMP report packets for MVR groups are not sent out on the multicast VLAN source ports. In contrast to dynamic mode, the switch does not send join messages to the router. The router must be statically configured for the interface to receive the multicast stream. Therefore, in this mode, MVR does not support dynamic membership joins on source ports.

Note

IGMPv3 join and leave messages are not supported on switches running MVR.

Using MVR in a Multicast Television Application

In a multicast television application, a PC or a television with a set-top box can receive the multicast stream. Multiple set-top boxes or PCs can be connected to one subscriber port, which is a switch port configured as an MVR receiver port. Figure 20-3 is an example configuration. When a subscriber selects a channel, the set-top box or PC sends an IGMP report to Switch A to join the appropriate multicast. If the IGMP report matches one of the configured multicast MAC addresses, the switch CPU modifies the hardware address table to include this receiver port and VLAN as a forwarding destination of the specified multicast stream when it is received from the multicast VLAN. Uplink ports that send and receive multicast data to and from the multicast VLAN are called MVR source ports.

When a subscriber changes channels or turns off the television, the set-top box sends an IGMP leave message for the multicast stream. The switch CPU sends an IGMP group-specific query through the receiver port VLAN. If there is another set-top box in the VLAN still subscribing to this group, that set-top box must respond within the maximum response time. If the CPU does not receive a response, it eliminates the receiver port as a forwarding destination for this group.

Without Immediate Leave, when the switch receives an IGMP leave message from a subscriber on a receiver port, it sends out an IGMP query on that port and waits for IGMP group membership reports. If no reports are received in a configured time period, the receiver port is removed from multicast group membership. With Immediate Leave, an IGMP query is not sent from the receiver port on which the IGMP leave was received. As soon as the leave message is received, the receiver port is removed from multicast group membership, which speeds up leave latency. Enable the Immediate Leave feature only on receiver ports to which a single receiver device is connected.
MVR eliminates the need to duplicate television-channel multicast traffic for subscribers in each VLAN. Multicast traffic for all channels is only sent around the VLAN trunk once—only on the multicast VLAN. Although the IGMP leave and join message in the VLAN to which the subscriber port is assigned. These messages dynamically register for streams of multicast traffic in the multicast VLAN on the Layer 3 device. The access layer switch (Switch A) modifies the forwarding behavior to allow the traffic to be forwarded from the multicast VLAN to the subscriber port in a different VLAN, selectively allowing traffic to cross between two VLANs.

IGMP reports are sent to the same MAC addresses as the multicast data. The Switch A CPU must capture all IGMP join and leave messages from receiver ports and forward them to the multicast VLAN of the source (uplink) port.
Configuring MVR

These sections include basic MVR configuration information:

- Default MVR Configuration, page 20-17
- MVR Configuration Guidelines and Limitations, page 20-17
- Configuring MVR Global Parameters, page 20-18
- Configuring MVR Interfaces, page 20-19

Default MVR Configuration

Table 20-5 shows the default MVR configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVR</td>
<td>Disabled globally and per interface</td>
</tr>
<tr>
<td>Multicast addresses</td>
<td>None configured</td>
</tr>
<tr>
<td>Query response time</td>
<td>0.5 second</td>
</tr>
<tr>
<td>Multicast VLAN</td>
<td>VLAN 1</td>
</tr>
<tr>
<td>Mode</td>
<td>Compatible</td>
</tr>
<tr>
<td>Interface (per port)</td>
<td>Neither a receiver nor a source port</td>
</tr>
<tr>
<td>Immediate Leave</td>
<td>Disabled on all ports</td>
</tr>
</tbody>
</table>

MVR Configuration Guidelines and Limitations

Follow these guidelines when configuring MVR:

- Receiver ports cannot be trunk ports. Receiver ports on a switch can be in different VLANs, but should not belong to the multicast VLAN.
- The maximum number of multicast entries that can be configured on a switch (that is, the maximum number of television channels that can be received) is 256.
- Each channel is one multicast stream destined for a unique IP multicast address. These IP addresses cannot alias between themselves or with the reserved IP multicast addresses (in the range 224.0.0.xxx).
- MVR does not support IGMPv3 messages.

Note

For complete syntax and usage information for the commands used in this section, see the command reference for this release.
Configuring MVR Global Parameters

You do not need to set the optional MVR parameters if you choose to use the default settings. If you do want to change the default parameters (except for the MVR VLAN), you must first enable MVR.

Beginning in privileged EXEC mode, follow these steps to configure MVR parameters:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>mvr</td>
<td>Enable MVR on the switch.</td>
</tr>
<tr>
<td>3</td>
<td>mvr group ip-address [count]</td>
<td>Configure an IP multicast address on the switch or use the count parameter to configure a contiguous series of MVR group addresses (the range for count is 1 to 256; the default is 1). Any multicast data sent to this address is sent to all source ports on the switch and all receiver ports that have elected to receive data on that multicast address. Each multicast address would correspond to one television channel. <strong>Note</strong> Each IP address translates to a multicast 48-bit MAC address. If an IP address being configured translates (aliases) to a previously configured MAC address or to any reserved multicast MAC addresses, the command fails.</td>
</tr>
<tr>
<td>4</td>
<td>mvr querytime value</td>
<td>(Optional) Define the maximum time to wait for IGMP report memberships on a receiver port before removing the port from multicast group membership. The value is in units of tenths of a second. The range is from 1 to 100 and the default is 5 tenths or one-half second.</td>
</tr>
<tr>
<td>5</td>
<td>mvr vlan vlan-id</td>
<td>(Optional) Specify the VLAN in which multicast data is received; all source ports must belong to this VLAN. The VLAN ID range is 1 to 4094. The default is VLAN 1.</td>
</tr>
</tbody>
</table>
| 6    | mvr mode {dynamic | compatible} | (Optional) Specify the MVR mode of operation:  
- **dynamic**—Allows dynamic MVR membership on source ports.  
- **compatible**—Is compatible with Catalyst 3500 XL and Catalyst 2900 XL switches and does not support IGMP dynamic joins on source ports.  
The default is compatible mode. |
| 7    | end | Return to privileged EXEC mode. |
| 8    | show mvr  
or  
show mvr members | Verify the configuration. |
| 9    | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To return the switch to its default settings, use the no mvr [mode | group ip-address | querytime | vlan] global configuration commands.

This example shows how to enable MVR, configure the MVR group address, set the query time to 1 second (10 tenths), specify the MVR multicast VLAN as VLAN 22, set the MVR mode as dynamic, and verify the results:

```
Switch(config)# mvr
Switch(config)# mvr group 228.1.23.4
```
You can use the `show mvr members` privileged EXEC command to verify the MVR multicast group addresses on the switch.

## Configuring MVR Interfaces

Beginning in privileged EXEC mode, follow these steps to configure MVR interfaces:

<table>
<thead>
<tr>

</table>
Displaying MVR Information

You can display MVR information for the switch or for a specified interface. Beginning in privileged EXEC mode, use the commands in Table 20-6 to display MVR configuration:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mvr</td>
<td>Displays MVR status and values for the switch—whether MVR is enabled or disabled, the multicast VLAN, the maximum (256) and current (0 through 256) number of multicast groups, the query response time, and the MVR mode.</td>
</tr>
</tbody>
</table>
| show mvr interface [interface-id] | Displays all MVR interfaces and their MVR configurations. When a specific interface is entered, displays this information:  
  - Type—Receiver or Source  
  - Status—One of these:  
    - Active means the port is part of a VLAN.  
    - Up/Down means that the port is forwarding or nonforwarding.  
    - Inactive means that the port is not part of any VLAN.  
  - Immediate Leave—Enabled or Disabled |
| show mvr members [ip-address] | Displays all receiver and source ports that are members of any IP multicast group or the specified IP multicast group IP address. |

To return the interface to its default settings, use the no mvr [type | immediate | vlan vlan-id | group] interface configuration commands.

This example shows how to configure a port as a receiver port, statically configure the port to receive multicast traffic sent to the multicast group address, configure Immediate Leave on the interface, and verify the results.

```
Switch(config)# mvr
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mvr type receiver
Switch(config-if)# mvr vlan 22 group 228.1.23.4
Switch(config-if)# mvr immediate
Switch(config)# end
Switch# show mvr interface gigabitethernet0/1
Type: RECEIVER Status: ACTIVE Immediate Leave: ENABLED
```
Configuring IGMP Filtering and Throttling

In some environments, for example, metropolitan or multiple-dwelling unit (MDU) installations, you might want to control the set of multicast groups to which a user on a switch port can belong. You can control the distribution of multicast services, such as IP/TV, based on some type of subscription or service plan. You might also want to limit the number of multicast groups to which a user on a switch port can belong.

With the IGMP filtering feature, you can filter multicast joins on a per-port basis by configuring IP multicast profiles and associating them with individual switch ports. An IGMP profile can contain one or more multicast groups and specifies whether access to the group is permitted or denied. If an IGMP profile denying access to a multicast group is applied to a switch port, the IGMP join report requesting the stream of IP multicast traffic is dropped, and the port is not allowed to receive IP multicast traffic from that group. If the filtering action permits access to the multicast group, the IGMP report from the port is forwarded for normal processing.

IGMP filtering controls only group specific query and membership reports, including join and leave reports. It does not control general IGMP queries. IGMP filtering has no relationship with the function that directs the forwarding of IP multicast traffic. The filtering feature operates in the same manner whether CGMP or MVR is used to forward the multicast traffic.

You can also set the maximum number of IGMP groups that a Layer 2 interface can join.

With the IGMP throttling feature, you can also set the maximum number of IGMP groups that a Layer 2 interface can join. If the maximum number of IGMP groups is set, the IGMP snooping forwarding table contains the maximum number of entries, and the interface receives an IGMP join report, you can configure an interface to drop the IGMP report or to replace the randomly selected multicast entry with the received IGMP report.

Note IGMPv3 join and leave messages are not supported on switches running IGMP filtering.

These sections describe how to configure IGMP filtering and throttling:
- Default IGMP Filtering and Throttling Configuration, page 20-21
- Configuring IGMP Profiles, page 20-22 (optional)
- Applying IGMP Profiles, page 20-23 (optional)
- Setting the Maximum Number of IGMP Groups, page 20-24 (optional)
- Configuring the IGMP Throttling Action, page 20-24 (optional)

Default IGMP Filtering and Throttling Configuration

Table 20-7 shows the default IGMP filtering configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGMP filters</td>
<td>None applied</td>
</tr>
<tr>
<td>IGMP Maximum number of IGMP groups</td>
<td>No maximum set</td>
</tr>
<tr>
<td>IGMP profiles</td>
<td>None defined</td>
</tr>
<tr>
<td>IGMP profile action</td>
<td>Deny the range addresses</td>
</tr>
</tbody>
</table>
When the maximum number of groups is in forwarding table, the default IGMP throttling action is to deny the IGMP report. For configuration guidelines, see the “Configuring the IGMP Throttling Action” section on page 20-24.

Configuring IGMP Profiles

To configure an IGMP profile, use the `ip igmp profile` global configuration command with a profile number to create an IGMP profile and to enter IGMP profile configuration mode. From this mode, you can specify the parameters of the IGMP profile to be used for filtering IGMP join requests from a port. When you are in IGMP profile configuration mode, you can create the profile by using these commands:

- **deny**: Specifies that matching addresses are denied; this is the default condition.
- **exit**: Exits from igmp-profile configuration mode.
- **no**: Negates a command or sets its defaults.
- **permit**: Specifies that matching addresses are permitted.
- **range**: Specifies a range of IP addresses for the profile. You can enter a single IP address or a range with a start and an end address.

The default is for the switch to have no IGMP profiles configured. When a profile is configured, if neither the **permit** nor **deny** keyword is included, the default is to deny access to the range of IP addresses.

Beginning in privileged EXEC mode, follow these steps to create an IGMP profile:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip igmp profile profile number</td>
</tr>
<tr>
<td></td>
<td>Enter IGMP profile configuration mode, and assign a number to the profile you are configuring. The range is 1 to 4294967295.</td>
</tr>
<tr>
<td>Step 3</td>
<td>permit</td>
</tr>
<tr>
<td></td>
<td>(Optional) Set the action to permit or deny access to the IP multicast address. If no action is configured, the default for the profile is to deny access.</td>
</tr>
<tr>
<td>Step 4</td>
<td>range ip multicast address</td>
</tr>
<tr>
<td></td>
<td>Enter the IP multicast address or range of IP multicast addresses to which access is being controlled. If entering a range, enter the low IP multicast address, a space, and the high IP multicast address. You can use the range command multiple times to enter multiple addresses or ranges of addresses.</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>show ip igmp profile profile number</td>
</tr>
<tr>
<td></td>
<td>Verify the profile configuration.</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To delete a profile, use the **no ip igmp profile profile number** global configuration command.

To delete an IP multicast address or range of IP multicast addresses, use the **no range ip multicast address** IGMP profile configuration command.

This example shows how to create IGMP profile 4 allowing access to the single IP multicast address and how to verify the configuration. If the action was to deny (the default), it would not appear in the **show ip igmp profile** output display.

Switch(config)# ip igmp profile 4
**Chapter 20 Configuring IGMP Snooping and MVR**

**Configuring IGMP Filtering and Throttling**

```plaintext
Switch(config-igmp-profile)# permit
Switch(config-igmp-profile)# range 229.9.9.0
Switch(config-igmp-profile)# end
Switch# show ip igmp profile 4
IGMP Profile 4
  permit
  range 229.9.9.0 229.9.9.0
```

**Applying IGMP Profiles**

To control access as defined in an IGMP profile, use the `ip igmp filter` interface configuration command to apply the profile to the appropriate interfaces. You can apply IGMP profiles to Layer 2 ports only. You cannot apply profiles to ports that belong to an EtherChannel port group. You can apply a profile to multiple interfaces, but each interface can only have one profile applied to it.

Beginning in privileged EXEC mode, follow these steps to apply an IGMP profile to a switch port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>ip igmp filter profile number</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running configuration interface interface-id</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove a profile from an interface, use the `no ip igmp filter profile number` interface configuration command.

This example shows how to apply IGMP profile 4 to a port and verify the configuration.

```
Switch(config)# interface
Switch(config-if)# ip igmp filter 4
Switch(config-if)# end
Switch# show running-config interface
Building configuration...

Current configuration : 123 bytes
!
interface
  no ip address
  shutdown
snmp trap link-status
ip igmp max-groups 25
ip igmp filter 4
end
```

To remove a profile from an interface, use the `no ip igmp filter profile number` interface configuration command.
### Setting the Maximum Number of IGMP Groups

You can set the maximum number of IGMP groups that a Layer 2 interface can join by using the `ip igmp max-groups` interface configuration command. Use the `no` form of this command to set the maximum back to the default, which is no limit.

You can use this command on an logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.

Beginning in privileged EXEC mode, follow these steps to set the maximum number of IGMP groups in the forwarding table:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter interface configuration mode by entering the physical interface to configure. The interface can be a Layer 2 port that does not belong to an EtherChannel group or an EtherChannel interface.</td>
</tr>
<tr>
<td>Step 3 ip igmp max-groups number</td>
<td>Set the maximum number of IGMP groups that the interface can join. The range is 0 to 4294967294. The default is to have no maximum set.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show running-configuration interface interface-id</td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the maximum group limitation and return to the default of no maximum, use the `no ip igmp max-groups` interface configuration command.

This example shows how to limit to 25 the number of IGMP groups that an interface can join.

```
Switch(config)# interface
Switch(config-if)# ip igmp max-groups 25
Switch(config-if)# end
```

### Configuring the IGMP Throttling Action

After you set the maximum number of IGMP groups that a Layer 2 interface can join, you can configure an interface to replace the existing group with the new group for which the IGMP report was received by using the `ip igmp max-groups action replace` interface configuration command. Use the `no` form of this command to return to the default, which is to drop the IGMP join report.

Follow these guidelines when configuring the IGMP throttling action:

- You can use this command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.
- When the maximum group limitation is set to the default (no maximum), entering the `ip igmp max-groups action {deny | replace}` command has no effect.
- If you configure the throttling action and set the maximum group limitation after an interface has added multicast entries to the forwarding table, the forwarding-table entries are either aged out or removed, depending on the throttling action.
If you configure the throttling action as **deny**, the entries that were previously in the forwarding table are not removed but are aged out. After these entries are aged out and the maximum number of entries is in the forwarding table, the switch drops the next IGMP report received on the interface.

- If you configure the throttling action as **replace**, the entries that were previously in the forwarding table are removed. When the maximum number of entries is in the forwarding table, the switch replaces a randomly selected entry with the received IGMP report.

To prevent the switch from removing the forwarding-table entries, you can configure the IGMP throttling action before an interface adds entries to the forwarding table.

Beginning in privileged EXEC mode, follow these steps to configure the throttling action when the maximum number of entries is in the forwarding table:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>interface interface-id</strong></td>
</tr>
</tbody>
</table>
| **Step 3** | **ip igmp max-groups action {deny | replace}** | When an interface receives an IGMP report and the maximum number of entries is in the forwarding table, specify the action that the interface takes:  
  - **deny**—Drop the report.  
  - **replace**—Replace the existing group with the new group for which the IGMP report was received. |
| **Step 4** | **end** | Return to privileged EXEC mode. |
| **Step 5** | **show running-config interface interface-id** | Verify the configuration. |
| **Step 6** | **copy running-config startup-config** | (Optional) Save your entries in the configuration file. |

To return to the default action of dropping the report, use the **no ip igmp max-groups action** interface configuration command.

**Displaying IGMP Filtering and Throttling Configuration**

You can display IGMP profile characteristics, and you can display the IGMP profile and maximum group configuration for all interfaces on the switch or for a specified interface. You can also display the IGMP throttling configuration for all interfaces on the switch or for a specified interface.
Use the privileged EXEC commands in Table 20-8 to display IGMP filtering and throttling configuration:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>how ip igmp profile [profile number]</code></td>
<td>Displays the specified IGMP profile or all the IGMP profiles defined on the switch.</td>
</tr>
<tr>
<td><code>show running-configuration [interface interface-id]</code></td>
<td>Displays the configuration of the specified interface or the configuration of all interfaces on the switch, including (if configured) the maximum number of IGMP groups to which an interface can belong and the IGMP profile applied to the interface.</td>
</tr>
</tbody>
</table>
CHAPTER 22

Configuring UDLD

This chapter describes how to configure the UniDirectional Link Detection (UDLD) protocol on your Catalyst 2950 or Catalyst 2955 switch.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Understanding UDLD, page 22-1
- Configuring UDLD, page 22-3
- Displaying UDLD Status, page 22-7

Understanding UDLD

UDLD is a Layer 2 protocol that enables devices connected through fiber-optic or twisted-pair Ethernet cables to monitor the physical configuration of the cables and detect when a unidirectional link exists. All connected devices must support UDLD for the protocol to successfully identify and disable unidirectional links. When UDLD detects a unidirectional link, it administratively shuts down the affected port and alerts you. Unidirectional links can cause a variety of problems, including spanning-tree topology loops.

Modes of Operation

UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD can detect unidirectional links due to misconnected interfaces on fiber-optic connections. In aggressive mode, UDLD can also detect unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and to misconnected interfaces on fiber-optic links.

In normal and aggressive modes, UDLD works with the Layer 1 mechanisms to determine the physical status of a link. At Layer 1, autonegotiation takes care of physical signaling and fault detection. UDLD performs tasks that autonegotiation cannot perform, such as detecting the identities of neighbors and shutting down misconnected interfaces. When you enable both autonegotiation and UDLD, the Layer 1 and Layer 2 detections work together to prevent physical and logical unidirectional connections and the malfunctioning of other protocols.
A unidirectional link occurs whenever traffic sent by a local device is received by its neighbor but traffic from the neighbor is not received by the local device.

In normal mode, UDLD detects a unidirectional link when fiber strands in a fiber-optic interface are misconnected and the Layer 1 mechanisms do not detect this misconnection. If the interfaces are connected correctly but the traffic is one way, UDLD does not detect the unidirectional link because the Layer 1 mechanism, which is supposed to detect this condition, does not do so. In case, the logical link is considered undetermined, and UDLD does not disable the interface.

When UDLD is in normal mode, if one of the fiber strands in a pair is disconnected and autonegotiation is active, the link does not stay up because the Layer 1 mechanisms did not detect a physical problem with the link. In this case, UDLD does not take any action, and the logical link is considered undetermined.

In aggressive mode, UDLD detects a unidirectional link by using the previous detection methods. UDLD in aggressive mode can also detect a unidirectional link on a point-to-point link on which no failure between the two devices is allowed. It can also detect a unidirectional link when one of these problems exists:

- On fiber-optic or twisted-pair links, one of the interfaces cannot send or receive traffic.
- On fiber-optic or twisted-pair links, one of the interfaces is down while the other is up.
- One of the fiber strands in the cable is disconnected.

In these cases, UDLD shuts down the affected interface.

In a point-to-point link, UDLD hello packets can be considered as a heart beat whose presence guarantees the health of the link. Conversely, the loss of the heart beat means that the link must be shut down if it is not possible to re-establish a bidirectional link.

If both fiber strands in a cable are working normally from a Layer 1 perspective, UDLD in aggressive mode determines whether those fiber strands are connected correctly and whether traffic is flowing bidirectionally between the correct neighbors. This check cannot be performed by autonegotiation because autonegotiation operates at Layer 1.

### Methods to Detect Unidirectional Links

UDLD operates by using two mechanisms:

- Neighbor database maintenance
  
  UDLD learns about other UDLD-capable neighbors by periodically sending a hello packet (also called an advertisement or probe) on every active interface to keep each device informed about its neighbors.

  When the switch receives a hello message, it caches the information until the age time (hold time or time-to-live) expires. If the switch receives a new hello message before an older cache entry ages, the switch replaces the older entry with the new one.

  Whenever an interface is disabled and UDLD is running, whenever UDLD is disabled on an interface, or whenever the switch is reset, UDLD clears all existing cache entries for the interfaces affected by the configuration change. UDLD sends at least one message to inform the neighbors to flush the part of their caches affected by the status change. The message is intended to keep the caches synchronized.

- Event-driven detection and echoing
UDLD relies on echoing as its detection mechanism. Whenever a UDLD device learns about a new neighbor or receives a resynchronization request from an out-of-sync neighbor, it restarts the detection window on its side of the connection and sends echo messages in reply. Because this behavior is the same on all UDLD neighbors, the sender of the echoes expects to receive an echo in reply.

If the detection window ends and no valid reply message is received, the link might shut down, depending on the UDLD mode. When UDLD is in normal mode, the link might be considered undetermined and might not be shut down. When UDLD is in aggressive mode, the link is considered unidirectional, and the interface is shut down.

If UDLD in normal mode is in the advertisement or in the detection phase and all the neighbor cache entries are aged out, UDLD restarts the link-up sequence to resynchronize with any potentially out-of-sync neighbors.

If you enable aggressive mode when all the neighbors of a port have aged out either in the advertisement or in the detection phase, UDLD restarts the link-up sequence to resynchronize with any potentially out-of-sync neighbor. UDLD shuts down the port if, after the fast train of messages, the link state is still undetermined.

Figure 22-1 shows an example of a unidirectional link condition.

**Figure 22-1 UDLD Detection of a Unidirectional Link**

Switch B successfully receives traffic from Switch A on this port. However, Switch A does not receive traffic from Switch B on the same port. If UDLD is in aggressive mode, it detects the problem and disables the port. If UDLD is in normal mode, the logical link is considered undetermined, and UDLD does not disable the interface.

## Configuring UDLD

This section describes how to configure UDLD on your switch. It contains this configuration information:

- Default UDLD Configuration, page 22-4
- Configuration Guidelines, page 22-4
- Enabling UDLD Globally, page 22-5
- Enabling UDLD on an Interface, page 22-5
- Resetting an Interface Shut Down by UDLD, page 22-6
Default UDLD Configuration

Table 22-1 shows the default UDLD configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>UDLD global enable state</td>
<td>Globally disabled</td>
</tr>
<tr>
<td>UDLD per-interface enable state for fiber-optic media</td>
<td>Disabled on all Ethernet fiber-optic interfaces</td>
</tr>
<tr>
<td>UDLD per-interface enable state for twisted-pair (copper) media</td>
<td>Disabled on all Ethernet 10/100 and 1000BASE-TX interfaces</td>
</tr>
<tr>
<td>UDLD aggressive mode</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

**Configuration Guidelines**

These are the UDLD configuration guidelines:

- A UDLD-capable interface also cannot detect a unidirectional link if it is connected to a UDLD-incapable port of another switch.
- When configuring the mode (normal or aggressive), make sure that the same mode is configured on both sides of the link.

**Caution**

Loop guard works only on point-to-point links. We recommend that each end of the link has a directly connected device that is running STP.
Enabling UDLD Globally

Beginning in privileged EXEC mode, follow these steps to enable UDLD in the aggressive or normal mode and to set the configurable message timer on all fiber-optic interfaces on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2** | udld {aggressive | enable | message time message-timer-interval} Specify the UDLD mode of operation:  
  - **aggressive**—Enables UDLD in aggressive mode on all fiber-optic interfaces.  
  - **enable**—Enables UDLD in normal mode on all fiber-optic interfaces on the switch. UDLD is disabled by default.  
  
  An individual interface configuration overrides the setting of the udld enable global configuration command.  
  
  For more information about aggressive and normal modes, see the “Modes of Operation” section on page 22-1.  
  
  - **message time message-timer-interval**—Configures the period of time between UDLD probe messages on ports that are in the advertisement phase and are determined to be bidirectional. The range is from 7 to 90 seconds. |
| **Note** | This command affects fiber-optic interfaces only. Use the udld interface configuration command to enable UDLD on other interface types. For more information, see the “Enabling UDLD on an Interface” section on page 22-5. |
| **Step 3** | end Return to privileged EXEC mode. |
| **Step 4** | show udld Verify your entries. |
| **Step 5** | copy running-config startup-config (Optional) Save your entries in the configuration file. |

To disable UDLD globally, use the no udld enable global configuration command to disable normal mode UDLD on all fiber-optic ports. Use the no udld aggressive global configuration command to disable aggressive mode UDLD on all fiber-optic ports.

Enabling UDLD on an Interface

Beginning in privileged EXEC mode, follow these steps to enable UDLD in the aggressive or normal mode on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id Specify the interface to be enabled for UDLD, and enter interface configuration mode.</td>
</tr>
</tbody>
</table>
Configuring UDLD

Chapter 22 Configuring UDLD

Configuring UDLD

To disable UDLD on a non-fiber-optic interface, use the `no udld port` interface configuration command.

**Note**

On fiber-optic interfaces, the `no udld port` command reverts the interface configuration to the `udld enable` global configuration command setting.

Use the `no udld port` interface configuration command to disable UDLD on a fiber-optic interface.

### Resetting an Interface Shut Down by UDLD

Beginning in privileged EXEC mode, follow these steps to reset all interfaces shut down by UDLD:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1     udld reset</td>
<td>Reset all interfaces shut down by UDLD.</td>
</tr>
<tr>
<td>Step 2    show udld</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 3  copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

You can also bring up the interface by using these commands:

- **The shutdown** interface configuration command followed by the `no shutdown` interface configuration command restarts the disabled interface.
- The `no udld {aggressive | enable}` global configuration command followed by the `udld {aggressive | enable}` global configuration command re-enables UDLD globally.
- The `no udld port` interface configuration command followed by the `udld port [aggressive]` interface configuration command re-enables UDLD on the specified interface.
- The `errdisable recovery cause udld` global configuration command enables the timer to automatically recover from the UDLD error-disabled state, and the `errdisable recovery interval interval` global configuration command specifies the time to recover from the UDLD error-disabled state.

**Command Purpose**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1     udld reset</td>
<td>Reset all interfaces shut down by UDLD.</td>
</tr>
<tr>
<td>Step 2    show udld</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 3  copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Displaying UDLD Status

To display the UDLD status for the specified interface or for all interfaces, use the `show udld [interface-id]` privileged EXEC command.

For detailed information about the fields in the display, see the command reference for this release.
Configuring CDP

This chapter describes how to configure Cisco Discovery Protocol (CDP) on your 2950 or Catalyst 2955 switch.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the.

This chapter consists of these sections:
- Understanding CDP, page 23-1
- Configuring CDP, page 23-2
- Monitoring and Maintaining CDP, page 23-4

Understanding CDP

CDP is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, and switches) and allows network management applications to discover Cisco devices that are neighbors of already known devices. With CDP, network management applications can learn the device type and the Simple Network Management Protocol (SNMP) agent address of neighboring devices running lower-layer, transparent protocols. This feature enables applications to send SNMP queries to neighboring devices.

CDP runs on all media that support Subnetwork Access Protocol (SNAP). Because CDP runs over the data-link layer only, two systems that support different network-layer protocols can learn about each other.

Each CDP-configured device sends periodic messages to a multicast address, advertising at least one address at which it can receive SNMP messages. The advertisements also contain time-to-live, or holdtime information, which is the length of time a receiving device holds CDP information before discarding it. Each device also listens to the messages sent by other devices to learn about neighboring devices.

On the switch, CDP enables the Network Assistant software to display a graphical view of the network. The switch uses CDP to find cluster candidates and maintain information about cluster members and other devices up to three cluster-enabled devices away from the command switch by default.

The switch supports CDP Version 2.
Configuring CDP

These sections include CDP configuration information and procedures:

- Default CDP Configuration, page 23-2
- Configuring the CDP Characteristics, page 23-2
- Disabling and Enabling CDP, page 23-3
- Disabling and Enabling CDP on an Interface, page 23-4

Default CDP Configuration

Table 23-1 shows the default CDP configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>CDP global state</td>
<td>Enabled</td>
</tr>
<tr>
<td>CDP interface state</td>
<td>Enabled</td>
</tr>
<tr>
<td>CDP timer (packet update frequency)</td>
<td>60 seconds</td>
</tr>
<tr>
<td>CDP holdtime (before discarding)</td>
<td>180 seconds</td>
</tr>
<tr>
<td>CDP Version-2 advertisements</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

Configuring the CDP Characteristics

You can configure the frequency of CDP updates, the amount of time to hold the information before discarding it, and whether or not to send Version-2 advertisements.

Beginning in privileged EXEC mode, follow these steps to configure the CDP timer, holdtime, and advertisement type.

Note
Steps 2 through 4 are all optional and can be performed in any order.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong> Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>        cdp timer <em>seconds</em></td>
<td>(Optional) Set the transmission frequency of CDP updates in seconds. The range is 5 to 254; the default is 60 seconds.</td>
</tr>
<tr>
<td><strong>Step 3</strong>            cdp holdtime <em>seconds</em></td>
<td>(Optional) Specify the amount of time a receiving device should hold the information sent by your device before discarding it. The range is 10 to 255 seconds; the default is 180 seconds.</td>
</tr>
<tr>
<td><strong>Step 4</strong>            cdp advertise-v2</td>
<td>(Optional) Configure CDP to send Version-2 advertisements. This is the default state.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>end</strong> Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Use the **no** form of the CDP commands to return to the default settings.

This example shows how to configure CDP characteristics.

```
Switch# configure terminal
Switch(config)# cdp timer 50
Switch(config)# cdp holdtime 120
Switch(config)# cdp advertise-v2
Switch(config)# end
```

For additional CDP **show** commands, see the “Monitoring and Maintaining CDP” section on page 23-4.

**Disabling and Enabling CDP**

CDP is enabled by default.

**Note**

Creating and maintaining switch clusters is based on the regular exchange of CDP messages. Disabling CDP can interrupt cluster discovery. For more information, see *Clustering Switches* and see the *Getting Started with Cisco Network Assistant*, available on Cisco.com. For more information about switch clusters, see Chapter 6, “Clustering Switches.”

Beginning in privileged EXEC mode, follow these steps to disable the CDP device discovery capability:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td>configure terminal</td>
<td>no cdp run</td>
</tr>
<tr>
<td></td>
<td>Disable CDP.</td>
</tr>
</tbody>
</table>

Beginning in privileged EXEC mode, follow these steps to enable CDP when it has been disabled:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td>configure terminal</td>
<td>cdp run</td>
</tr>
<tr>
<td></td>
<td>Enable CDP after disabling it.</td>
</tr>
</tbody>
</table>

This example shows how to enable CDP if it has been disabled.

```
Switch# configure terminal
Switch(config)# cdp run
Switch(config)# end
```
Disabling and Enabling CDP on an Interface

CDP is enabled by default on all supported interfaces to send and receive CDP information.

Beginning in privileged EXEC mode, follow these steps to disable CDP on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no cdp enable</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Beginning in privileged EXEC mode, follow these steps to enable CDP on an interface when it has been disabled:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>cdp enable</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to enable CDP on an interface when it has been disabled.

Switch# configure terminal
Switch(config)# interface fastethernet0/1
Switch(config-if)# cdp enable
Switch(config-if)# end

Monitoring and Maintaining CDP

To monitor and maintain CDP on your device, perform one or more of these tasks, beginning in privileged EXEC mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear cdp counters</td>
<td>Reset the traffic counters to zero.</td>
</tr>
<tr>
<td>clear cdp table</td>
<td>Delete the CDP table of information about neighbors.</td>
</tr>
<tr>
<td>show cdp</td>
<td>Display global information, such as frequency of transmissions and the holdtime for packets being sent.</td>
</tr>
</tbody>
</table>
## Chapter 23      Configuring CDP

### Monitoring and Maintaining CDP

#### Command Line Interface Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show cdp entry</code></td>
<td>Display information about a specific neighbor. You can enter an asterisk (*) to display all CDP neighbors, or you can enter the name of the neighbor about which you want information. You can also limit the display to information about the protocols enabled on the specified neighbor or information about the version of software running on the device.</td>
</tr>
<tr>
<td><code>show cdp interface</code></td>
<td>Display information about interfaces where CDP is enabled. You can limit the display to the interface about which you want information.</td>
</tr>
<tr>
<td><code>show cdp neighbors</code></td>
<td>Display information about neighbors, including device type, interface type and number, holdtime settings, capabilities, platform, and port ID. You can limit the display to neighbors on a specific type or number of interface or expand the display to provide more detailed information.</td>
</tr>
<tr>
<td><code>show cdp traffic</code></td>
<td>Display CDP counters, including the number of packets sent and received and checksum errors.</td>
</tr>
</tbody>
</table>
Configuring SPAN and RSPAN

This chapter describes how to configure Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) on your Catalyst 2950 or Catalyst 2955.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:
- Understanding SPAN and RSPAN, page 24-1
- Configuring SPAN, page 24-7
- Configuring RSPAN, page 24-11
- Displaying SPAN and RSPAN Status, page 24-16

Understanding SPAN and RSPAN

You can analyze network traffic passing through ports by using SPAN to send a copy of the traffic to another port on the switch that has been connected to a SwitchProbe device or other Remote Monitoring (RMON) probe or security device. SPAN mirrors received or sent (or both) traffic on one or more source ports to a destination port for analysis.

For example, in Figure 24-1, all traffic on port 4 (the source port) is mirrored to port 8 (the destination port). A network analyzer on port 8 receives all network traffic from port 4 without being physically attached to port 4.
Understanding SPAN and RSPAN

Only traffic that enters or leaves source ports can be monitored by using SPAN. RSPAN extends SPAN by enabling remote monitoring of multiple switches across your network. The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating switches. The SPAN traffic from the sources is copied onto the RSPAN VLAN through a reflector port and then forwarded over trunk ports that are carrying the RSPAN VLAN to any RSPAN destination sessions monitoring the RSPAN VLAN, as shown in Figure 24-2.

SPAN and RSPAN do not affect the switching of network traffic on source ports; a copy of the packets received or sent by the source interfaces are sent to the destination interface. Except for traffic that is required for the SPAN or RSPAN session, reflector ports and destination ports do not receive or forward traffic.

You can use the SPAN destination port to inject traffic from a network security device. For example, if you connect a Cisco Intrusion Detection System (IDS) Sensor Appliance to a destination port, the IDS device can send TCP Reset packets to close down the TCP session of a suspected attacker.

Note: You cannot use the RSPAN destination port to inject traffic from a network security device. The switch does not support ingress forwarding on an RSPAN destination port.
SPAN and RSPAN Concepts and Terminology

This section describes concepts and terminology associated with SPAN and RSPAN configuration.

SPAN Session

A local SPAN session is an association of a destination port with source ports. You can monitor incoming or outgoing traffic on a series or range of ports.

An RSPAN session is an association of source ports across your network with an RSPAN VLAN. The destination source is the RSPAN VLAN.

SPAN sessions do not interfere with the normal operation of the switch. However, an oversubscribed SPAN destination, for example, a 10-Mbps port monitoring a 100-Mbps port, results in dropped or lost packets.

You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port for that session. The `show monitor session session_number` privileged EXEC command displays the operational status of a SPAN session.

A SPAN session remains inactive after system power-on until the destination port is operational.

Traffic Types

SPAN sessions include these traffic types:

- **Receive (Rx) SPAN**—The goal of receive (or ingress) SPAN is to monitor as much as possible all the packets received by the source interface. A copy of each packet received by the source is sent to the destination port for that SPAN session. You can monitor a series or range of ingress ports in a SPAN session.

  At the destination port, if tagging is enabled, the packets appear with the IEEE 802.1Q header. If no tagging is specified, packets appear in the native format.

  Packets that are modified because of quality of service (QoS)—for example, modified Differentiated Services Code Point (DSCP)—are copied with modification for Rx SPAN.

- **Transmit (Tx) SPAN**—The goal of transmit (or egress) SPAN is to monitor as much as possible all the packets sent by the source interface after all modification and processing is performed by the switch. A copy of each packet sent by the source is sent to the destination port for that SPAN session. The copy is provided after the packet is modified. You can monitor a range of egress ports in a SPAN session.

  For packets that are modified because of QoS, the modified packet might not have the same DSCP (IP packet) or CoS (non-IP packet) as the SPAN source.

  Some features that can cause a packet to be dropped during transmit processing might also affect the duplicated copy for SPAN. These features include IP standard and extended output ACLs on multicast packets, and egress QoS policing. In the case of output ACLs, if the SPAN source drops the packet, the SPAN destination would also drop the packet. If the source port is oversubscribed, the destination ports will have different dropping behavior.

- **Both**—In a SPAN session, you can monitor a series or range of ports for both received and sent packets.
Source Port

A source port (also called a monitored port) is a switched port that you monitor for network traffic analysis. In a single local SPAN session or RSPAN source session, you can monitor source port traffic such as received (Rx), transmitted (Tx), or bidirectional (both). The switch supports any number of source ports (up to the maximum number of available ports on the switch).

A source port has these characteristics:

- It can be any port type (for example, EtherChannel, Fast Ethernet, Gigabit Ethernet, and so forth).
- It cannot be a destination port.
- Each source port can be configured with a direction (ingress, egress, or both) to monitor. For EtherChannel sources, the monitored direction would apply to all the physical ports in the group.
- Source ports can be in the same or different VLANs.

You can configure a trunk port as a source port. All VLANs active on the trunk are monitored.

Destination Port

Each local SPAN session or RSPAN destination session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source port.

The destination port has these characteristics:

- It must reside on the same switch as the source port (for a local SPAN session).
- It can be any Ethernet physical port.
- It cannot be a source port or a reflector port.
- It cannot be an EtherChannel group or a VLAN.
- It can be a physical port that is assigned to an EtherChannel group, even if the EtherChannel group has been specified as a SPAN source. The port is removed from the group while it is configured as a SPAN destination port.
- The port does not transmit any traffic except that required for the SPAN session.
- If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.
- It does not participate in spanning tree while the SPAN session is active.
- When it is a destination port, it does not participate in any of the Layer 2 protocols—Cisco Discovery Protocol (CDP), VLAN Trunk Protocol (VTP), Dynamic Trunking Protocol (DTP), Spanning Tree Protocol (STP), Port Aggregation Protocol (PagP), and Link Aggregation Control Protocol (LACP).
- No address learning occurs on the destination port.
- A destination port receives copies of sent and received traffic for all monitored source ports. If a destination port is oversubscribed, it could become congested. This could affect traffic forwarding on one or more of the source ports.
Reflector Port

The reflector port is the mechanism that copies packets onto an RSPAN VLAN. The reflector port forwards only the traffic from the RSPAN source session with which it is affiliated. Any device connected to a port set as a reflector port loses connectivity until the RSPAN source session is disabled.

The reflector port has these characteristics:

- It is a port set to loopback.
- It cannot be an EtherChannel group, it does not trunk, and it cannot do protocol filtering.
- It can be a physical port that is assigned to an EtherChannel group, even if the EtherChannel group is specified as a SPAN source. The port is removed from the group while it is configured as a reflector port.
- A port used as a reflector port cannot be a SPAN source or destination port, nor can a port be a reflector port for more than one session at a time.
- It is invisible to all VLANs.
- The native VLAN for looped-back traffic on a reflector port is the RSPAN VLAN.
- The reflector port loops back untagged traffic to the switch. The traffic is then placed on the RSPAN VLAN and flooded to any trunk ports that carry the RSPAN VLAN.
- Spanning tree is automatically disabled on a reflector port.
- A reflector port receives copies of sent and received traffic for all monitored source ports. If a reflector port is oversubscribed, it could become congested. This could affect traffic forwarding on one or more of the source ports.

If the bandwidth of the reflector port is not sufficient for the traffic volume from the corresponding source ports, the excess packets are dropped. A 10/100 port reflects at 100 Mbps. A Gigabit port reflects at 1 Gbps.

SPAN Traffic

You can use local SPAN to monitor all network traffic, including multicast and bridge protocol data unit (BPDU) packets, and CDP, VTP, DTP, STP, PagP, and LACP packets. You cannot use RSPAN to monitor Layer 2 protocols. See the “RSPAN Configuration Guidelines” section on page 24-11 for more information.

In some SPAN configurations, multiple copies of the same source packet are sent to the SPAN destination port. For example, a bidirectional (both Rx and Tx) SPAN session is configured for the sources a1 Rx monitor and the a2 Rx and Tx monitor to destination port d1. If a packet enters the switch through a1 and is switched to a2, both incoming and outgoing packets are sent to destination port d1.

SPAN and RSPAN Interaction with Other Features

SPAN interacts with these features:

- Spanning Tree Protocol (STP)—A destination port or a reflector port does not participate in STP while its SPAN or RSPAN session is active. The destination or reflector port can participate in STP after the SPAN or RSPAN session is disabled. On a source port, SPAN does not affect the STP status. STP can be active on trunk ports carrying an RSPAN VLAN.
- Cisco Discovery Protocol (CDP)—A SPAN destination port does not participate in CDP while the SPAN session is active. After the SPAN session is disabled, the port again participates in CDP.
• VLAN Trunking Protocol (VTP)—You can use VTP to prune an RSPAN VLAN between switches.

• VLAN and trunking—You can modify VLAN membership or trunk settings for source, or destination, or reflector ports at any time. However, changes in VLAN membership or trunk settings for a destination or reflector port do not take effect until you disable the SPAN or RSPAN session. Changes in VLAN membership or trunk settings for a source port immediately take effect, and the SPAN session automatically adjusts accordingly.

• EtherChannel—You can configure an EtherChannel group as a source port but not as a SPAN destination port. When a group is configured as a SPAN source, the entire group is monitored.

If a port is added to a monitored EtherChannel group, the new port is added to the SPAN source port list. If a port is removed from a monitored EtherChannel group, it is automatically removed from the source port list. If the port is the only port in the EtherChannel group, the EtherChannel group is removed from SPAN.

If a physical port that belongs to an EtherChannel group is configured as a SPAN source, destination, or reflector port, it is removed from the group. After the port is removed from the SPAN session, it rejoins the EtherChannel group. Ports removed from an EtherChannel group remain members of the group, but they are in the down or standalone state.

If a physical port that belongs to an EtherChannel group is a destination or reflector port and the EtherChannel group is a source, the port is removed from the EtherChannel group and from the list of monitored ports.

• QoS—For ingress monitoring, the packets sent to the SPAN destination port might be different from the packets actually received at the SPAN source port because the packets are forwarded after ingress QoS classification and policing. The packet DSCP might not be the same as the received packet.

• Multicast traffic can be monitored. For egress and ingress port monitoring, only a single unedited packet is sent to the SPAN destination port. It does not reflect the number of times the multicast packet is sent.

• Port security—A secure port cannot be a SPAN destination port.

**SPAN and RSPAN Session Limits**

You can configure (and store in NVRAM) one local SPAN session or multiple RSPAN sessions on a switch. The number of active sessions and combinations are subject to these restrictions:

• SPAN or RSPAN source (rx, tx, both): 1 active session limit. (SPAN and RSPAN are mutually exclusive on a source switch).

• RSPAN source sessions have one destination per session with an RSPAN VLAN associated for that session.

• Each RSPAN destination session has one or more destination interfaces for each RSPAN VLAN that they support.

• RSPAN destination sessions are limited to two, or one if a local SPAN or a source RSPAN session is configured on the same switch.
Default SPAN and RSPAN Configuration

Table 24-1 shows the default SPAN and RSPAN configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPAN state</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Source port traffic to monitor</td>
<td>Both received and sent traffic (both)</td>
</tr>
<tr>
<td>Encapsulation type (destination port)</td>
<td>Native form (no encapsulation type header).</td>
</tr>
<tr>
<td>Ingress forwarding (destination port)</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>

Configuring SPAN

This section describes how to configure SPAN on your switch. It contains this configuration information:

- SPAN Configuration Guidelines, page 24-7
- Creating a SPAN Session and Specifying Ports to Monitor, page 24-8
- Creating a SPAN Session and Enabling Ingress Traffic, page 24-9
- Removing Ports from a SPAN Session, page 24-10

SPAN Configuration Guidelines

Follow these guidelines when configuring SPAN:

- SPAN sessions can coexist with RSPAN sessions within the limits described in the “SPAN and RSPAN Session Limits” section on page 24-6.
- The destination port cannot be a source port; a source port cannot be a destination port.
- You can have only one destination port per SPAN session. You cannot have two SPAN sessions using the same destination port.
- An EtherChannel port can be a SPAN source port; it cannot be a SPAN destination port.
- For SPAN source ports, you can monitor sent and received traffic for a single port or for a series or range of ports.
- When you configure a switch port as a SPAN destination port, it is no longer a normal switch port; only monitored traffic passes through the SPAN destination port.
- You can configure a disabled port to be a source or destination port, but the SPAN function does not start until the destination port and at least one source port enabled.
- A SPAN destination port never participates in any VLAN spanning tree. SPAN does include BPDUs in the monitored traffic, so any spanning-tree BPDUs received on the SPAN destination port for a SPAN session were copied from the SPAN source ports.
- When SPAN is enabled, configuration changes have these results:
  - If you change the VLAN configuration of a destination port, the change is not effective until SPAN is disabled.
If you disable all source ports or the destination port, the SPAN function stops until both a source and the destination port are enabled.

Creating a SPAN Session and Specifying Ports to Monitor

Beginning in privileged EXEC mode, follow these steps to create a SPAN session and specify the source (monitored) and destination (monitoring) ports:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>no monitor session [session_number</td>
</tr>
<tr>
<td>Step 3</td>
<td>monitor session session_number source interface interface-id [,</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>monitor session session_number destination interface interface-id [encapsulation {dot1q}]]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show monitor [session session_number]</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to set up a SPAN session, session 1, for monitoring source port traffic to a destination port. First, any existing SPAN configuration for session 1 is cleared, and then bidirectional traffic is mirrored from source port 17 to destination port 8.
### Creating a SPAN Session and Enabling Ingress Traffic

Beginning in privileged EXEC mode, follow these steps to create a SPAN session, to specify the source and destination ports, and to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance):

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| 2    | no monitor session \{session_number | Clear any existing SPAN configuration for the session.  
|      | all | Specify all to remove all SPAN sessions, local to remove all local sessions, or remote to remove all remote SPAN sessions. |
|      | local \} | |
| 3    | monitor session session_number source interface interface-id \[, |-] \[both | Specify the SPAN session and the source port (monitored port).  
|      | \] both | For session_number, specify 1.  
|      | \] rx | For interface-id, specify the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel port-channel-number). (Optional) \[, |-\] Specify a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen. (Optional) Specify the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both sent and received traffic.  
|      | \] tx | • both—Monitor both received and sent traffic.  
|      | \] | • rx—Monitor received traffic.  
|      | \] | • tx—Monitor sent traffic. |
| 4    | monitor session session_number destination interface interface-id \[encapsulation \{dot1q\}] \[ingress vlan vlan id\] | Specify the SPAN session, the destination port (monitoring port), the packet encapsulation, and the ingress VLAN.  
|      | \] | For session_number, specify 1.  
|      | \] | For interface-id, specify the destination port. Valid interfaces include physical interfaces. (Optional) Specify the IEEE 802.1Q encapsulation header for outgoing packets. If not specified, packets are sent in native form. (Optional) Enter ingress vlan vlan id to enable ingress forwarding and specify a default VLAN |
| 5    | end | Return to privileged EXEC mode. |
| 6    | show monitor \[session session_number\] | Verify your entries. |
| 7    | copy running-config startup-config | (Optional) Save your entries in the configuration file. |
This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that does not support IEEE 802.1Q encapsulation.

```
Switch(config)# monitor session 1 destination interface fastethernet0/5 ingress vlan 5
```

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports IEEE 802.1Q encapsulation.

```
Switch(config)# monitor session 1 destination interface fastethernet0/5 encapsulation dot1q ingress vlan 5
```

This example shows how to disable ingress traffic forwarding on the destination port.

```
Switch(config)# monitor session 1 destination interface fastethernet0/5 encapsulation dot1q
```

### Removing Ports from a SPAN Session

Beginning in privileged EXEC mode, follow these steps to remove a port as a SPAN source for a session:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>no monitor session session_number source interface interface-id [[,] [-] [both</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show monitor [session session_number]</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove a source or destination port from the SPAN session, use the `no monitor session session_number source interface interface-id` global configuration command or the `no monitor session session_number destination interface interface-id` global configuration command. To change the encapsulation type back to the default (native), use the `monitor session session_number destination interface interface-id` without the `encapsulation` keyword.

This example shows how to remove a port as a SPAN source for SPAN session 1:

```
Switch(config)# no monitor session 1 source interface fastethernet0/1
Switch(config)# end
```
This example shows how to disable received traffic monitoring on a port that was configured for bidirectional monitoring:

```
Switch(config)# no monitor session 1 source interface fastethernet0/1 rx
```

The monitoring of traffic received on port 1 is disabled, but traffic sent from this port continues to be monitored.

## Configuring RSPAN

This section describes how to configure RSPAN on your switch. It contains this configuration information:

- RSPAN Configuration Guidelines, page 24-11
- Configuring a VLAN as an RSPAN VLAN, page 24-12
- Creating an RSPAN Source Session, page 24-13
- Creating an RSPAN Destination Session, page 24-14
- Removing Ports from an RSPAN Session, page 24-15

### RSPAN Configuration Guidelines

To use the RSPAN feature described in this section, you must have the EI installed on your switch. Follow these guidelines when configuring RSPAN:

- All the items in the “SPAN Configuration Guidelines” section on page 24-7 apply to RSPAN.
- As RSPAN VLANs have special properties, you should reserve a few VLANs across your network for use as RSPAN VLANs; do not assign access ports to these VLANs.
- RSPAN sessions can coexist with SPAN sessions within the limits described in the “SPAN and RSPAN Session Limits” section on page 24-6.
- For RSPAN configuration, you can distribute the source ports and the destination ports across multiple switches in your network.
- A port cannot serve as an RSPAN source port or RSPAN destination port while designated as an RSPAN reflector port.
- When you configure a switch port as a reflector port, it is no longer a normal switch port; only looped-back traffic passes through the reflector port.
- RSPAN does not support BPDU packet monitoring or other Layer 2 switch protocols, or any other traffic to or from the switch’s IP address and MAC address including management traffic.
- In a network consisting of only Catalyst 2950 or Catalyst 2955 switches, you must use a unique RSPAN VLAN session on each source switch. If more than one source switch uses the same RSPAN VLAN, the switches are limited to act only as source switches to ensure the delivery of all monitored traffic to the destination switch.
- You can configure any VLAN as an RSPAN VLAN as long as these conditions are met:
  - The RSPAN VLAN is not configured as a native VLAN.
  - Extended range RSPAN VLANs will not be propagated to other switches using VTP.
  - No access port is configured in the RSPAN VLAN.
All participating switches support RSPAN.

Note: The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 through 1005 (reserved for Token Ring and FDDI VLANs).

- You should create an RSPAN VLAN before configuring an RSPAN source or destination session.
- If you enable VTP and VTP pruning, RSPAN traffic is pruned in the trunks to prevent the unwanted flooding of RSPAN traffic across the network for VLAN-IDs that are lower than 1005.

### Configuring a VLAN as an RSPAN VLAN

First create a new VLAN to be the RSPAN VLAN for the RSPAN session. You must create the RSPAN VLAN in all switches that will participate in RSPAN. If the RSPAN VLAN-ID is in the normal range (lower than 1005) and VTP is enabled in the network, you can create the RSPAN VLAN in one switch, and VTP propagates it to the other switches in the VTP domain. For extended-range VLANs (greater than 1005), you must configure RSPAN VLAN on both source and destination switches and any intermediate switches.

Use VTP pruning to get an efficient flow of RSPAN traffic, or manually delete the RSPAN VLAN from all trunks that do not need to carry the RSPAN traffic.

Beginning in privileged EXEC mode, follow these steps to create an RSPAN VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
</tbody>
</table>
| **Step 2** | vlan vlan-id | Enter a VLAN ID to create a VLAN, or enter the VLAN ID of an existing VLAN, and enter VLAN configuration mode. The range is 2 to 1001 and 1006 to 4094.  
**Note**: The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 through 1005 (reserved for Token Ring and FDDI VLANs). |
| **Step 3** | remote-span | Configure the VLAN as an RSPAN VLAN. |
| **Step 4** | end | Return to privileged EXEC mode. |
| **Step 5** | copy running-config startup-config | (Optional) Save the configuration in the configuration file. |

To remove the remote SPAN characteristic from a VLAN and convert it back to a normal VLAN, use the **no remote-span** VLAN configuration command.

This example shows how to create RSPAN VLAN 901.

```
Switch(config)# vlan 901
Switch(config-vlan)# remote span
Switch(config-vlan)# end
```
Creating an RSPAN Source Session

Beginning in privileged EXEC mode, follow these steps to start an RSPAN source session and to specify the monitored source and the destination RSPAN VLAN:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>no monitor session {session_number</td>
<td>all</td>
</tr>
<tr>
<td>3</td>
<td>monitor session session_number source interface interface-id [, -] [both</td>
<td>rx</td>
</tr>
<tr>
<td>4</td>
<td>monitor session session_number destination remote vlan vlan-id reflector-port interface</td>
<td>Specify the RSPAN session, the destination remote VLAN, and the reflector port. For session_number, enter the session number identified with this RSPAN session. For vlan-id, specify the RSPAN VLAN to carry the monitored traffic to the destination port. (See the “Creating or Modifying an Ethernet VLAN” section on page 16-8 for more information about creating an RSPAN VLAN.) For interface, specify the interface that will flood the RSPAN traffic onto the RSPAN VLAN.</td>
</tr>
<tr>
<td>5</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>6</td>
<td>show monitor [session session_number]</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>7</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
This example shows how to clear any existing RSPAN configuration for session 1, configure RSPAN session 1 to monitor multiple source interfaces, and configure the destination RSPAN VLAN and the reflector-port.

Switch(config)# no monitor session 1
Switch(config)# monitor session 1 source interface fastethernet0/10 tx
Switch(config)# monitor session 1 source interface fastethernet0/2 rx
Switch(config)# monitor session 1 source interface fastethernet0/3 rx
Switch(config)# monitor session 1 source interface port-channel 102 rx
Switch(config)# monitor session 1 destination remote vlan 901 reflector-port fastethernet0/1
Switch(config)# end

Creating an RSPAN Destination Session

Beginning in privileged EXEC mode, follow these steps to create an RSPAN destination session and to specify the source RSPAN VLAN and the destination port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>monitor session session_number source remote vlan vlan-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>monitor session session_number destination interface interface-id [encapsulation {dot1q}]</td>
</tr>
<tr>
<td></td>
<td>dot1q</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show monitor [session session_number]</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to configure VLAN 901 as the source remote VLAN and port 5 as the destination interface:

Switch(config)# monitor session 1 source remote vlan 901
Switch(config)# monitor session 1 destination interface fastethernet0/5
Switch(config)# end
Removing Ports from an RSPAN Session

Beginning in privileged EXEC mode, follow these steps to remove a port as an RSPAN source for a session:

### Command

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2 | no monitor session session_number source interface interface-id [,, -] [both | rx | tx] | Specify the characteristics of the RSPAN source port (monitored port) to remove.  
For **session_number**, specify the session number identified with this RSPAN session.  
For **interface-id**, specify the source port to no longer monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (**port-channel port-channel-number**).  
(Optional) Use [,, -] to specify a series or range of interfaces if they were configured. Enter a space before and after the comma; enter a space before and after the hyphen.  
(Optional) Specify the direction of traffic (both, rx, or tx) to no longer monitor. If you do not specify a traffic direction, both transmit and receive are disabled. |
| Step 3 | end | Return to privileged EXEC mode. |
| Step 4 | show monitor [session session_number] | Verify your entries. |
| Step 5 | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

This example shows how to remove port 17 as an RSPAN source for RSPAN session 1:

Switch(config)# no monitor session 1 source interface fastEthernet0/1  
Switch(config)# end

This example shows how to disable received traffic monitoring on port 1, which was configured for bidirectional monitoring:

Switch(config)# no monitor session 1 source interface fastEthernet0/1 rx

The monitoring of traffic received on port 1 is disabled, but traffic sent from this port continues to be monitored.
Displaying SPAN and RSPAN Status

To display the status of the current SPAN or RSPAN configuration, use the `show monitor` privileged EXEC command.

This is an example of output for the `show monitor` privileged EXEC command for SPAN source session 1:

```
Switch# show monitor session 1
Session 1
--------
Type : Local Session
Source Ports :
  RX Only : None
  TX Only : None
  Both : Fa0/4
Source VLANs :
  RX Only : None
  TX Only : None
  Both : None
Source RSPAN VLAN : None
Destination Ports : Fa0/5
Encapsulation: DOT1Q
  Ingress: Enabled, default VLAN = 5
Reflector Port : None
Filter VLANs : None
Dest RSPAN VLAN : None
```
CHAPTER 25

Configuring RMON

This chapter describes how to configure Remote Network Monitoring (RMON) on your Catalyst 2950 or Catalyst 2955 switch. RMON is a standard monitoring specification that defines a set of statistics and functions that can be exchanged between RMON-compliant console systems and network probes. RMON provides you with comprehensive network-fault diagnosis, planning, and performance-tuning information.

Note

For complete syntax and usage information for the commands used in this chapter, see the Cisco IOS Configuration Fundamentals Command Reference for Cisco IOS Release 12.1.

This chapter consists of these sections:

- Understanding RMON, page 25-1
- Configuring RMON, page 25-2
- Displaying RMON Status, page 25-6

Understanding RMON

RMON is an Internet Engineering Task Force (IETF) standard monitoring specification that allows various network agents and console systems to exchange network monitoring data. You can use the RMON feature with the Simple Network Management Protocol (SNMP) agent in the switch to monitor all the traffic flowing among switches on all connected LAN segments.
Figure 25-1  Remote Monitoring Example

Network management station with
generic RMON console application

RMON alarms and events
configured. SNMP configured.

RMON history
and statistic
collection enabled.

Workstations

The switch supports these RMON groups (defined in RFC 1757):

- Statistics (RMON group 1)—Collects Ethernet, Fast Ethernet, and Gigabit Ethernet statistics on an interface.
- History (RMON group 2)—Collects a history group of statistics on Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces for a specified polling interval.
- Alarm (RMON group 3)—Monitors a specific MIB object for a specified interval, triggers an alarm at a specified value (rising threshold), and resets the alarm at another value (falling threshold). Alarms can be used with events; the alarm triggers an event, which can generate a log entry or an SNMP trap.
- Event (RMON group 9)—Determines the action to take when an event is triggered by an alarm. The action can be to generate a log entry or an SNMP trap.

Because switches supported by this software release use hardware counters for RMON data processing, the monitoring is more efficient, and little processing power is required.

Configuring RMON

This section describes how to configure RMON on your switch. It contains this configuration information:

- Default RMON Configuration, page 25-3
- Configuring RMON Alarms and Events, page 25-3
- Configuring RMON Collection on an Interface, page 25-4
Default RMON Configuration

RMON is disabled by default; no alarms or events are configured.
Only RMON 1 is supported on the switch.

Configuring RMON Alarms and Events

You can configure your switch for RMON by using the command-line interface (CLI) or an SNMP-compatible network management station. We recommend that you use a generic RMON console application on the network management station (NMS) to take advantage of RMON’s network management capabilities. You must also configure SNMP on the switch to access RMON MIB objects. For more information, see Chapter 27, “Configuring SNMP.”

Note
RMON configuration, status, and display for remote CPE Fast Ethernet interfaces is supported through SNMP only by using the RMON-MIB.

Beginning in privileged EXEC mode, follow these steps to enable RMON alarms and events:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>rmon alarm number variable interval {absolute</td>
<td>delta} rising-threshold value [event-number] falling-threshold value [event-number] [owner string]</td>
</tr>
</tbody>
</table>

- For number, specify the alarm number. The range is 1 to 65535.
- For variable, specify the MIB object to monitor.
- For interval, specify the time in seconds the alarm monitors the MIB variable. The range is 1 to 4294967295 seconds.
- Specify the absolute keyword to test each MIB variable directly; specify the delta keyword to test the change between samples of a MIB variable.
- For value, specify a number at which the alarm is triggered and one for when the alarm is reset. The range for the rising threshold and falling threshold values is -2147483648 to 2147483647.
- (Optional) For event-number, specify the event number to trigger when the rising or falling threshold exceeds its limit.
- (Optional) For owner string, specify the owner of the alarm.
Configuring RMON

To disable an alarm, use the `no rmon alarm number` global configuration command on each alarm you configured. You cannot disable at once all the alarms that you configured. To disable an event, use the `no rmon event number` global configuration command. To learn more about alarms and events and how they interact with each other, see RFC 1757.

You can set an alarm on any MIB object. The following example configures RMON alarm number 10 by using the `rmon alarm` command. The alarm monitors the MIB variable `ifEntry.20.1` once every 20 seconds until the alarm is disabled and checks the change in the variable’s rise or fall. If the `ifEntry.20.1` value shows a MIB counter increase of 15 or more, such as from 100000 to 100015, the alarm is triggered. The alarm in turn triggers event number 1, which is configured with the `rmon event` command. Possible events can include a log entry or an SNMP trap. If the `ifEntry.20.1` value changes by 0, the alarm is reset and can be triggered again.

```
Switch(config)# rmon alarm 10 ifEntry.20.1 20 delta rising-threshold 15 1
falling-threshold 0 owner jjohnson
```

The following example creates RMON event number 1 by using the `rmon event` command. The event is defined as High ifOutErrors and generates a log entry when the event is triggered by the alarm. The user `jjones` owns the row that is created in the event table by this command. This example also generates an SNMP trap when the event is triggered.

```
Switch(config)# rmon event 1 log trap eventtrap description “High ifOutErrors” owner jjones
```

Configuring RMON Collection on an Interface

You must first configure RMON alarms and events to display collection information.
Beginning in privileged EXEC mode, follow these steps to collect group history statistics on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specify the interface on which to collect history, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>rmon collection history index [buckets bucket-number] [interval seconds] [owner ownername]</td>
</tr>
<tr>
<td></td>
<td>Enable history collection for the specified number of buckets and time period.</td>
</tr>
<tr>
<td></td>
<td>- For <strong>index</strong>, identify the RMON group of statistics. The range is 1 to 65535.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For <strong>buckets</strong> bucket-number, specify the maximum number of buckets desired for the RMON collection history group of statistics. The range is 1 to 65535. The default is 50 buckets.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For <strong>interval</strong> seconds, specify the number of seconds in each polling cycle.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For <strong>owner</strong> ownername, enter the name of the owner of the RMON group of statistics.</td>
</tr>
</tbody>
</table>

**Step 4** | end |
| | Return to privileged EXEC mode. |
| **Step 5** | show running-config |
| | Verify your entries. |
| **Step 6** | show rmon history |
| | Display the contents of the switch history table. |
| **Step 7** | copy running-config startup-config |
| | (Optional) Save your entries in the configuration file. |

To disable history collection, use the **no rmon collection history index** interface configuration command.

Beginning in privileged EXEC mode, follow these steps to collect group Ethernet statistics on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specify the interface on which to collect statistics, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>rmon collection stats index [owner ownername]</td>
</tr>
<tr>
<td></td>
<td>Enable RMON statistic collection on the interface.</td>
</tr>
<tr>
<td></td>
<td>- For <strong>index</strong>, specify the RMON group of statistics. The range is from 1 to 65535.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For <strong>owner</strong> ownername, enter the name of the owner of the RMON group of statistics.</td>
</tr>
</tbody>
</table>

**Step 4** | end |
| | Return to privileged EXEC mode. |
| **Step 5** | show running-config |
| | Verify your entries. |
| **Step 6** | show rmon statistics |
| | Display the contents of the switch statistics table. |
| **Step 7** | copy running-config startup-config |
| | (Optional) Save your entries in the configuration file. |
To disable the collection of group Ethernet statistics, use the `no rmon collection stats index` interface configuration command.

## Displaying RMON Status

To display the RMON status, use one or more of the privileged EXEC commands in Table 25-1:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show rmon</code></td>
<td>Displays general RMON statistics.</td>
</tr>
<tr>
<td><code>show rmon alarms</code></td>
<td>Displays the RMON alarm table.</td>
</tr>
<tr>
<td><code>show rmon events</code></td>
<td>Displays the RMON event table.</td>
</tr>
<tr>
<td><code>show rmon history</code></td>
<td>Displays the RMON history table.</td>
</tr>
<tr>
<td><code>show rmon statistics</code></td>
<td>Displays the RMON statistics table.</td>
</tr>
</tbody>
</table>

For information about the fields in these displays, see the *Cisco IOS Configuration Fundamentals Command Reference for Cisco IOS Release 12.1*. 
Configuring System Message Logging

This chapter describes how to configure system message logging on your Catalyst 2950 or Catalyst 2955 switch.

For complete syntax and usage information for the commands used in this chapter, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.1.

This chapter consists of these sections:

- Understanding System Message Logging, page 26-1
- Configuring System Message Logging, page 26-2
- Displaying the Logging Configuration, page 26-12

Understanding System Message Logging

By default, a switch sends the output from system messages and debug privileged EXEC commands to a logging process. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

The syslog format is compatible with 4.3 BSD UNIX.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the console after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the console and each of the destinations. You can timestamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer. You can remotely monitor system messages by accessing the switch through Telnet, through the console port, or by viewing the logs on a syslog server.
Configuring System Message Logging

These sections describe how to configure system message logging:

- System Log Message Format, page 26-2
- Default System Message Logging Configuration, page 26-3
- Disabling and Enabling Message Logging, page 26-3
- Setting the Message Display Destination Device, page 26-4
- Synchronizing Log Messages, page 26-5
- Enabling and Disabling Timestamps on Log Messages, page 26-6
- Enabling and Disabling Sequence Numbers in Log Messages, page 26-7
- Defining the Message Severity Level, page 26-8
- Limiting Syslog Messages Sent to the History Table and to SNMP, page 26-9
- Configuring UNIX Syslog Servers, page 26-10

System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or timestamp information, if configured. Messages appear in this format:

```
seq no:timestamp: %facility-severity-MNEMONIC:description
```

The part of the message preceding the percent sign depends on the setting of the `service sequence-numbers`, `service timestamps log datetime`, `service timestamps log datetime [localtime] [msec] [show-timezone]`, or `service timestamps log uptime` global configuration command.

Table 26-1 describes the elements of syslog messages.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seq no:</td>
<td>Stamps log messages with a sequence number only if the <code>service sequence-numbers</code> global configuration command is configured. For more information, see the “Enabling and Disabling Sequence Numbers in Log Messages” section on page 26-7.</td>
</tr>
<tr>
<td>timestamp formats:</td>
<td>Date and time of the message or event. This information appears only if the `service timestamps log [datetime</td>
</tr>
<tr>
<td>facility</td>
<td>The facility to which the message refers (for example, SNMP, SYS, and so forth). For a list of supported facilities, see Table 26-4 on page 26-11.</td>
</tr>
<tr>
<td>severity</td>
<td>Single-digit code from 0 to 7 that is the severity of the message. For a description of the severity levels, see Table 26-3 on page 26-8.</td>
</tr>
</tbody>
</table>
Chapter 26  Configuring System Message Logging

Configuring System Message Logging

This example shows a partial switch system message:

00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state to down 2

*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar 1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)

Table 26-2 shows the default system message logging configuration.

Table 26-2  Default System Message Logging Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>System message logging to the console</td>
<td>Enabled.</td>
</tr>
<tr>
<td>Console severity</td>
<td>Debugging (and numerically lower levels; see Table 26-3 on page 26-8).</td>
</tr>
<tr>
<td>Logging buffer size</td>
<td>4096 bytes.</td>
</tr>
<tr>
<td>Logging history size</td>
<td>1 message.</td>
</tr>
<tr>
<td>Timestamps</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Synchronous logging</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Logging server</td>
<td>Disabled.</td>
</tr>
<tr>

<td>None configured.</td>
</tr>
<tr>
<td>Server facility</td>
<td>Local7 (see Table 26-4 on page 26-11).</td>
</tr>
<tr>
<td>Server severity</td>
<td>Informational (and numerically lower levels; see Table 26-3 on page 26-8).</td>
</tr>
</tbody>
</table>

Disabling and Enabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

Beginning in privileged EXEC mode, follow these steps to disable message logging:
Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The logging synchronous global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press Return. For more information, see the “Synchronizing Log Messages” section on page 26-5.

To re-enable message logging after it has been disabled, use the logging on global configuration command.

**Setting the Message Display Destination Device**

If message logging is enabled, you can send messages to specific locations in addition to the console. Beginning in privileged EXEC mode, use one or more of the following commands to specify the locations that receive messages:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>no logging console</td>
<td>Disable message logging.</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>or</td>
<td>show logging</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The logging synchronous global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press Return. For more information, see the “Synchronizing Log Messages” section on page 26-5.

To re-enable message logging after it has been disabled, use the logging on global configuration command.

**Setting the Message Display Destination Device**

If message logging is enabled, you can send messages to specific locations in addition to the console. Beginning in privileged EXEC mode, use one or more of the following commands to specify the locations that receive messages:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>logging buffered [size]</td>
<td>Log messages to an internal buffer. The default buffer size is 4096. The range is 4096 to 4294967295 bytes.</td>
</tr>
<tr>
<td>Note</td>
<td>Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the show memory privileged EXEC command to view the free processor memory on the switch; however, this value is the maximum available, and the buffer size should not be set to this amount.</td>
</tr>
<tr>
<td>logging host</td>
<td>Log messages to a UNIX syslog server host.</td>
</tr>
<tr>
<td>For host, specify the name or IP address of the host to be used as the syslog server.</td>
<td></td>
</tr>
<tr>
<td>To build a list of syslog servers that receive logging messages, enter this command more than once.</td>
<td></td>
</tr>
<tr>
<td>For complete syslog server configuration steps, see the “Configuring UNIX Syslog Servers” section on page 26-10.</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 26  Configuring System Message Logging

Configuring System Message Logging

The **logging buffered** global configuration command copies logging messages to an internal buffer. The buffer is circular, so newer messages overwrite older messages after the buffer is full. To display the messages that are logged in the buffer, use the **show logging** privileged EXEC command. The first message displayed is the oldest message in the buffer. To clear the contents of the buffer, use the **clear logging** privileged EXEC command.

To disable logging to the console, use the **no logging console** global configuration command. To disable logging to a file, use the **no logging file [severity-level-number | type]** global configuration command.

### Step 4

**Command:**

- **logging file flash:filename**
- **[max-file-size] [min-file-size]**
- **[severity-level-number | type]**

**Purpose:** Store log messages in a file in flash memory.

- For **filename**, enter the log message filename.
- (Optional) For **max-file-size**, specify the maximum logging file size. The range is 4096 to 2147483647. The default is 4069 bytes.
- (Optional) For **min-file-size**, specify the minimum logging file size. The range is 1024 to 2147483647. The default is 2048 bytes.
- (Optional) For **severity-level-number | type**, specify either the logging severity level or the logging type. The severity range is 0 to 7. For a list of logging type keywords, see Table 26-3 on page 26-8. By default, the log file receives debugging messages and numerically lower levels.

### Step 5

**Command:** **end**

**Purpose:** Return to privileged EXEC mode.

### Step 6

**Command:** **terminal monitor**

**Purpose:** Log messages to a nonconsole terminal during the current session.

Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.

### Step 7

**Command:** **show running-config**

**Purpose:** Verify your entries.

### Step 8

**Command:** **copy running-config startup-config**

**Purpose:** (Optional) Save your entries in the configuration file.

### Synchronizing Log Messages

You can configure the system to synchronize unsolicited messages and **debug** privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also determine the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and **debug** command output is enabled, unsolicited device output appears on the console or is printed after solicited device output appears or is printed. Unsolicited messages and **debug** command output appears on the console after the prompt for user input is returned. Therefore, unsolicited messages and **debug** command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.
Beginning in privileged EXEC mode, follow these steps to configure synchronous logging:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>line [console</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>] line-number</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>logging synchronous [level severity-level</td>
</tr>
<tr>
<td></td>
<td>all] [limit number-of-buffers]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable synchronization of unsolicited messages and debug output, use the no logging synchronous [level severity-level | all] [limit number-of-buffers] line configuration command.

**Enabling and Disabling Timestamps on Log Messages**

By default, log messages are not timestamped.

Beginning in privileged EXEC mode, follow these steps to enable timestamping of log messages:
To disable timestamps for both debug and log messages, use the `no service timestamps` global configuration command.

This example shows part of a logging display with the `service timestamps log uptime` global configuration command enabled:

```
%Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

This example shows part of a logging display with the `service timestamps log datetime` global configuration command enabled:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
```

### Enabling and Disabling Sequence Numbers in Log Messages

Because there is a chance that more than one log message can have the same timestamp, you can display messages with sequence numbers so that you can unambiguously see a single message. By default, sequence numbers in log messages are not displayed.

Beginning in privileged EXEC mode, follow these steps to enable sequence numbers in log messages:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>service sequence-numbers</code></td>
<td>Enable sequence numbers.</td>
</tr>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>show running-config</code></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable sequence numbers, use the `no service sequence-numbers` global configuration command.

This example shows part of a logging display with sequence numbers enabled:

```000019: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)```
Defining the Message Severity Level

You can limit messages displayed to the selected device by specifying the severity level of the message, which are described in Table 26-3.

Beginning in privileged EXEC mode, follow these steps to define the message severity level:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>logging console level</td>
<td>Limit messages logged to the console. By default, the console receives</td>
</tr>
<tr>
<td></td>
<td>debugging messages and numerically lower levels (see Table 26-3 on page</td>
</tr>
<tr>
<td></td>
<td>26-8).</td>
</tr>
<tr>
<td>logging monitor level</td>
<td>Limit messages logged to the terminal lines. By default, the terminal</td>
</tr>
<tr>
<td></td>
<td>receives debugging messages and numerically lower levels (see Table 26-3</td>
</tr>
<tr>
<td></td>
<td>on page 26-8).</td>
</tr>
<tr>
<td>logging trap level</td>
<td>Limit messages logged to the syslog servers. By default, syslog servers</td>
</tr>
<tr>
<td></td>
<td>receive informational messages and numerically lower levels (see Table</td>
</tr>
<tr>
<td></td>
<td>26-3 on page 26-8).</td>
</tr>
<tr>
<td></td>
<td>For complete syslog server configuration steps, see the “Configuring</td>
</tr>
<tr>
<td></td>
<td>UNIX Syslog Servers” section on page 26-10.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config or</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>show logging</td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Note**

Specifying a level causes messages at that level and numerically lower levels to appear at the destination.

To disable logging to the console, use the no logging console global configuration command. To disable logging to a terminal other than the console, use the no logging monitor global configuration command. To disable logging to syslog servers, use the no logging trap global configuration command.

Table 26-3 describes the level keywords. It also lists the corresponding UNIX syslog definitions from the most severe level to the least severe level.

<table>
<thead>
<tr>
<th>Level Keyword</th>
<th>Level</th>
<th>Description</th>
<th>Syslog Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>emergencies</td>
<td>0</td>
<td>System unstable</td>
<td>LOG_EMERG</td>
</tr>
<tr>
<td>alerts</td>
<td>1</td>
<td>Immediate action needed</td>
<td>LOG_ALERT</td>
</tr>
<tr>
<td>critical</td>
<td>2</td>
<td>Critical conditions</td>
<td>LOG_CRIT</td>
</tr>
<tr>
<td>errors</td>
<td>3</td>
<td>Error conditions</td>
<td>LOG_ERR</td>
</tr>
<tr>
<td>warnings</td>
<td>4</td>
<td>Warning conditions</td>
<td>LOG_WARNING</td>
</tr>
</tbody>
</table>
Chapter 26  Configuring System Message Logging

The software generates four other categories of messages:

- Error messages about software or hardware malfunctions that appear at levels warnings through emergencies. These types of messages mean that the functionality of the switch is affected. For information on how to recover from these malfunctions, see the system message guide for this release.

- Output from the debug commands, displayed at the debugging level. Debug commands are typically used only by the Technical Assistance Center.

- Interface up or down transitions and system restart messages, displayed at the notifications level. This message is only for information; switch functionality is not affected.

- Reload requests and low-process stack messages, displayed at the informational level. This message is only for information; switch functionality is not affected.

Limiting Syslog Messages Sent to the History Table and to SNMP

If you enabled syslog message traps to be sent to an SNMP network management station by using the snmp-server enable trap global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level warning and numerically lower levels (see Table 26-3 on page 26-8) are stored in the history table even if syslog traps are not enabled.

Beginning in privileged EXEC mode, follow these steps to change the level and history table size defaults:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2** logging history level | Change the default level of syslog messages stored in the history file and sent to the SNMP server.  
See Table 26-3 on page 26-8 for a list of level keywords.  
By default, warnings, errors, critical, alerts, and emergencies messages are sent. |
| **Step 3** logging history size number | Specify the number of syslog messages that can be stored in the history table.  
The default is to store one message. The range is 1 to 500 messages. |
| **Step 4** end                   | Return to privileged EXEC mode.                                          |
Chapter 26  Configuring System Message Logging

Configuring System Message Logging

When the history table is full (it contains the maximum number of message entries specified with the `logging history size` global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

To return the logging of syslog messages to the default level, use the `no logging history` global configuration command. To return the number of messages in the history table to the default value, use the `no logging history size` global configuration command.

Configuring UNIX Syslog Servers

The next sections describe how to configure the UNIX server syslog daemon and how to define the UNIX system logging facility.

Logging Messages to a UNIX Syslog Daemon

Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server. Log in as root, and perform these steps:

---

**Step 1**

Add a line such as the following to the file `/etc/syslog.conf`:

```
local7.debug /usr/adm/logs/cisco.log
```

The `local7` keyword specifies the logging facility to be used; see Table 26-4 on page 26-11 for information on the facilities. The `debug` keyword specifies the syslog level; see Table 26-3 on page 26-8 for information on the severity levels. The syslog daemon sends messages at this level or at a more severe level to the file specified in the next field. The file must already exist, and the syslog daemon must have permission to write to it.

**Step 2**

Create the log file by entering these commands at the UNIX shell prompt:

```
$ touch /var/log/cisco.log
$ chmod 666 /var/log/cisco.log
```

**Step 3**

Make sure the syslog daemon reads the new changes:

```
$ kill -HUP `cat /etc/syslog.pid`
```

For more information, see the `man syslog.conf` and `man syslogd` commands on your UNIX system.

---

1. Table 26-3 lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, emergencies equal 1, not 0, and critical equals 3, not 2.
Configuring the UNIX System Logging Facility

When sending system log messages to an external device, you can cause the switch to identify its messages as originating from any of the UNIX syslog facilities.

Beginning in privileged EXEC mode, follow these steps to configure UNIX system facility message logging:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>logging host</td>
<td>Log messages to a UNIX syslog server host by entering its IP address.</td>
</tr>
<tr>
<td></td>
<td>To build a list of syslog servers that receive logging messages, enter this command more than once.</td>
</tr>
<tr>
<td>logging trap level</td>
<td>Limit messages logged to the syslog servers.</td>
</tr>
<tr>
<td></td>
<td>Be default, syslog servers receive informational messages and lower. See Table 26-3 on page 26-8 for level keywords.</td>
</tr>
<tr>
<td>logging facility facility-type</td>
<td>Configure the syslog facility. See Table 26-4 on page 26-11 for facility-type keywords.</td>
</tr>
<tr>
<td></td>
<td>The default is local7.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove a syslog server, use the no logging host global configuration command, and specify the syslog server IP address. To disable logging to syslog servers, enter the no logging trap global configuration command.

Table 26-4 lists the UNIX system facilities supported by the software. For more information about these facilities, consult the operator’s manual for your UNIX operating system.

<table>
<thead>
<tr>
<th>Facility Type Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth</td>
<td>Authorization system</td>
</tr>
<tr>
<td>cron</td>
<td>Cron facility</td>

Configuring SNMP

This chapter describes how to configure the Simple Network Management Protocol (SNMP) on your Catalyst 2950 or Catalyst 2955 switch.

For complete syntax and usage information for the commands used in this chapter, see the switch command reference for this release and to the Cisco IOS Configuration Fundamentals Command Reference for Release 12.1.

This chapter consists of these sections:

- Understanding SNMP, page 27-1
- Configuring SNMP, page 27-5
- Displaying SNMP Status, page 27-16

Understanding SNMP

SNMP is an application-layer protocol that provides a message format for communication between managers and agents. The SNMP system consists of an SNMP manager, an SNMP agent, and a MIB. The SNMP manager can be part of a network management system (NMS) such as CiscoWorks. The agent and MIB reside on the switch. To configure SNMP on the switch, you define the relationship between the manager and the agent.

The SNMP agent contains MIB variables whose values the SNMP manager can request or change. A manager can get a value from an agent or store a value into the agent. The agent gathers data from the MIB, the repository for information about device parameters and network data. The agent can also respond to a manager’s requests to get or set data.

An agent can send unsolicited traps to the manager. Traps are messages alerting the SNMP manager to a condition on the network. Traps can mean improper user authentication, restarts, link status (up or down), MAC address tracking, closing of a TCP connection, loss of connection to a neighbor, or other significant events.

This section includes information about these topics:

- SNMP Versions, page 27-2
- SNMP Manager Functions, page 27-3
- SNMP Agent Functions, page 27-3
- SNMP Community Strings, page 27-4
SNMP Versions

This software release supports these SNMP versions:

- **SNMPv1**—The Simple Network Management Protocol, a Full Internet Standard, defined in RFC 1157.

- **SNMPv2C** replaces the Party-based Administrative and Security Framework of SNMPv2Classic with the community-string-based Administrative Framework of SNMPv2C while retaining the bulk retrieval and improved error handling of SNMPv2Classic. It has these features:
  - **SNMPv2**—Version 2 of the Simple Network Management Protocol, a Draft Internet Standard, defined in RFCs 1902 through 1907.
  - **SNMPv2C**—The community-string-based Administrative Framework for SNMPv2, an Experimental Internet Protocol defined in RFC 1901.

- **SNMPv3**—Version 3 of the SNMP is an interoperable standards-based protocol defined in RFCs 2273 to 2275. SNMPv3 provides secure access to devices by authenticating and encrypting packets over the network and includes these security features:
  - Message integrity—ensuring that a packet was not tampered with in transit
  - Authentication—determining that the message is from a valid source
  - Encryption—mixing the contents of a package to prevent it from being read by an unauthorized source.

| Note | To select encryption, enter the `priv` keyword. This keyword is available only when the cryptographic (encrypted) software image is installed. |

Both SNMPv1 and SNMPv2C use a community-based form of security. The community of managers able to access the agent’s MIB is defined by an IP address access control list and password.

SNMPv2C includes a bulk retrieval mechanism and more detailed error message reporting to management stations. The bulk retrieval mechanism retrieves tables and large quantities of information, minimizing the number of round-trips required. The SNMPv2C improved error-handling includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes in SNMPv2C report the error type.

SNMPv3 provides for both security models and security levels. A security model is an authentication strategy set up for a user and the group within which the user resides. A security level is the permitted level of security within a security model. A combination of the security level and the security model determine which security mechanism is used when handling an SNMP packet. Available security models are SNMPv1, SNMPv2C, and SNMPv3.

Table 27-1 identifies the characteristics of the different combinations of security models and levels.
Understanding SNMP

You must configure the SNMP agent to use the SNMP version supported by the management station. Because an agent can communicate with multiple managers, you can configure the software to support communications using SNMPv1, SNMPv2C, or SNMPv3.

SNMP Manager Functions

The SNMP manager uses information in the MIB to perform the operations described in Table 27-2.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get-request</td>
<td>Retrieves a value from a specific variable.</td>
</tr>
<tr>
<td>get-next-request</td>
<td>Retrieves a value from a variable within a table.</td>
</tr>
<tr>
<td>get-bulk-request</td>
<td>Retrieves large blocks of data, such as multiple rows in a table, that would otherwise require the transmission of many small blocks of data.</td>
</tr>
<tr>
<td>get-response</td>
<td>Replies to a get-request, get-next-request, and set-request sent by an NMS.</td>
</tr>
<tr>
<td>set-request</td>
<td>Stores a value in a specific variable.</td>
</tr>
<tr>
<td>trap</td>
<td>An unsolicited message sent by an SNMP agent to an SNMP manager when some event has occurred.</td>
</tr>
</tbody>
</table>

1. With this operation, an SNMP manager does not need to know the exact variable name. A sequential search is performed to find the needed variable from within a table.
2. The get-bulk command only works with SNMPv2 or later.

SNMP Agent Functions

The SNMP agent responds to SNMP manager requests as follows:

- Get a MIB variable—The SNMP agent begins this function in response to a request from the NMS. The agent retrieves the value of the requested MIB variable and responds to the NMS with that value.
- Set a MIB variable—The SNMP agent begins this function in response to a message from the NMS. The SNMP agent changes the value of the MIB variable to the value requested by the NMS.
The SNMP agent also sends unsolicited trap messages to notify an NMS that a significant event has occurred on the agent. Examples of trap conditions include, but are not limited to, when a port or module goes up or down, when spanning-tree topology changes occur, and when authentication failures occur.

**SNMP Community Strings**

SNMP community strings authenticate access to MIB objects and function as embedded passwords. In order for the NMS to access the switch, the community string definitions on the NMS must match at least one of the three community string definitions on the switch.

A community string can have one of these attributes:

- **Read-only (RO)—** Gives read access to authorized management stations to all objects in the MIB except the community strings, but does not allow write access
- **Read-write (RW)—** Gives read and write access to authorized management stations to all objects in the MIB, but does not allow access to the community strings

*Note* When a cluster is created, the command switch manages the exchange of messages among member switches and the SNMP application. The Network Assistant software appends the member switch number (@esN, where N is the switch number) to the first configured RW and RO community strings on the command switch and propagates them to the member switches. For more information, see Chapter 6, “Clustering Switches” and see the *Getting Started with Cisco Network Assistant*, available on Cisco.com.

**Using SNMP to Access MIB Variables**

An example of an NMS is the CiscoWorks network management software. CiscoWorks 2000 software uses the switch MIB variables to set device variables and to poll devices on the network for specific information. The results of a poll can be displayed as a graph and analyzed to troubleshoot internetworking problems, increase network performance, verify the configuration of devices, monitor traffic loads, and more.

As shown in Figure 27-1, the SNMP agent gathers data from the MIB. The agent can send traps, or notification of certain events, to the SNMP manager, which receives and processes the traps. Traps alert the SNMP manager to a condition on the network such as improper user authentication, restarts, link status (up or down), MAC address tracking, and so forth. The SNMP agent also responds to MIB-related queries sent by the SNMP manager in *get-request*, *get-next-request*, and *set-request* format.

*Figure 27-1  SNMP Network*

For information on supported MIBs and how to access them, see Appendix A, “Supported MIBs.”
SNMP Notifications

SNMP allows the switch to send notifications to SNMP managers when particular events occur. SNMP notifications can be sent as traps or inform requests. In command syntax, unless there is an option in the command to select either traps or informs, the keyword *traps* refers to either traps or informs, or both. Use the `snmp-server host` command to specify whether to send SNMP notifications as traps or informs.

**Note**

SNMPv1 does not support informs.

Traps are unreliable because the receiver does not send an acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. When an SNMP manager receives an inform request, it acknowledges the message with an SNMP response protocol data unit (PDU). If the sender does not receive a response, the inform request can be sent again. Because they can be re-sent, informs are more likely than traps to reach their intended destination.

The characteristics that make informs more reliable than traps also consume more resources in the switch and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request is held in memory until a response is received or the request times out. Traps are sent only once, but an inform might be re-sent or retried several times. The retries increase traffic and contribute to a higher overhead on the network. Therefore, traps and informs require a trade-off between reliability and resources. If it is important that the SNMP manager receive every notification, use inform requests. If traffic on the network or memory in the switch is a concern and notification is not required, use traps.

Configuring SNMP

This section describes how to configure SNMP on your switch. It contains this configuration information:

- Default SNMP Configuration, page 27-5
- SNMP Configuration Guidelines, page 27-6
- Disabling the SNMP Agent, page 27-7
- Configuring Community Strings, page 27-7
- Configuring SNMP Groups and Users, page 27-9
- Configuring SNMP Notifications, page 27-11
- Setting the Agent Contact and Location Information, page 27-14
- Limiting TFTP Servers Used Through SNMP, page 27-15
- SNMP Examples, page 27-15

Default SNMP Configuration

Table 27-3 shows the default SNMP configuration.
Configuring SNMP

SNMP Configuration Guidelines

If the switch starts and the switch startup configuration has at least one `snmp-server` global configuration command, the SNMP agent is enabled.

An SNMP group is a table that maps SNMP users to SNMP views. An SNMP user is a member of an SNMP group. An SNMP host is the recipient of an SNMP trap operation. An SNMP engine ID is a name for the local or remote SNMP engine.

Before using alarm profiles to set the Catalyst 2955 switch to send SNMP alarm trap notifications to an SNMP server, you must first enable SNMP by using the `snmp-server enable traps alarms` global configuration command.

When configuring SNMP, follow these guidelines:

- When configuring an SNMP group, do not specify a notify view. The `snmp-server host` global configuration command autogenerates a notify view for the user and then adds it to the group associated with that user. Modifying the group's notify view affects all users associated with that group. See the Cisco IOS Configuration Fundamentals Command Reference for Release 12.1 for information about when you should configure notify views.

- To configure a remote user, specify the IP address or port number for the remote SNMP agent of the device where the user resides.

- Before you configure remote users for a particular agent, configure the SNMP engine ID, using the `snmp-server engineID` global configuration with the `remote` option. The remote agent's SNMP engine ID and user password are used to compute the authentication and privacy digests. If you do not configure the remote engine ID first, the configuration command fails.

- When configuring SNMP informs, you need to configure the SNMP engine ID for the remote agent in the SNMP database before you can send proxy requests or informs to it.

- If a local user is not associated with a remote host, the switch does not send informs for the `auth` (authNoPriv) and the `priv` (authPriv) authentication levels.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMP agent</td>
<td>Disabled¹</td>
</tr>
<tr>
<td>SNMP community strings</td>
<td>Read-Only: Public</td>
</tr>
<tr>
<td></td>
<td>Read-Write: Private</td>
</tr>
<tr>
<td>SNMP trap receiver</td>
<td>None configured.</td>
</tr>
<tr>
<td>SNMP traps</td>
<td>None enabled except the trap for TCP connections (<code>tty</code>).</td>
</tr>
<tr>
<td>SNMP version</td>
<td>If no <code>version</code> keyword is present, the default is Version 1.</td>
</tr>
<tr>
<td>SNMPv3 authentication</td>
<td>If no keyword is entered, the default is the <code>noauth</code> (noAuthNoPriv) security level.</td>
</tr>
<tr>
<td>SNMP notification type</td>
<td>If no type is specified, all notifications are sent.</td>
</tr>
</tbody>
</table>

¹. This is the default when the switch starts and the startup configuration does not have any `snmp-server` global configuration commands.

Table 27-3 Default SNMP Configuration
• Changing the value of the SNMP engine ID has important side effects. A user's password (entered on the command line) is converted to an MD5 or SHA security digest based on the password and the local engine ID. The command-line password is then destroyed, as required by RFC 2274. Because of this deletion, if the value of engineID changes, the security digests of SNMPv3 users become invalid, and you need to reconfigure SNMP users by using the `snmp-server user username` global configuration command. Similar restrictions require the reconfiguration of community strings when the engine ID changes.

**Disabling the SNMP Agent**

Beginning in privileged EXEC mode, follow these steps to disable the SNMP agent:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 no snmp-server</td>
<td>Disable the SNMP agent operation.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The `no snmp-server` global configuration command disables all running versions (Version 1, Version 2C, and Version 3) on the device. No specific Cisco IOS command exists to enable SNMP. The first `snmp-server` global configuration command that you enter enables all versions of SNMP.

**Configuring Community Strings**

You use the SNMP community string to define the relationship between the SNMP manager and the agent. The community string acts like a password to permit access to the agent on the switch. Optionally, you can specify one or more of these characteristics associated with the string:

• An access list of IP addresses of the SNMP managers that are permitted to use the community string to gain access to the agent

• A MIB view, which defines the subset of all MIB objects accessible to the given community

• Read and write or read-only permission for the MIB objects accessible to the community
Beginning in privileged EXEC mode, follow these steps to configure a community string on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>snmp-server community string [view name] [ro</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

**Note** To disable access for an SNMP community, set the community string for that community to the null string (do not enter a value for the community string).
To remove a specific community string, use the `no snmp-server community string` global configuration command.

This example shows how to assign the string `comaccess` to SNMP, to allow read-only access, and to specify that IP access list 4 can use the community string to gain access to the switch SNMP agent:

```
Switch(config)# snmp-server community comaccess ro 4
```

### Configuring SNMP Groups and Users

You can specify an identification name (engineID) for the local or remote SNMP server engine on the switch. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

Beginning in privileged EXEC mode, follow these steps to configure SNMP on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>snmp-server engineID {local engineid-string</td>
</tr>
<tr>
<td></td>
<td>• The <code>engineid-string</code> is a 24-character ID string with the name of the copy of SNMP. You need not specify the entire 24-character engine ID if it contains trailing zeros. Specify only the portion of the engine ID up to the point where only zeros remain in the value. For example, to configure an engine ID of 123400000000000000000000, you can enter this: <code>snmp-server engineID local 1234</code></td>
</tr>
<tr>
<td></td>
<td>• If you select <code>remote</code>, specify the <code>ip-address</code> of the device that contains the remote copy of SNMP and the optional User Datagram Protocol (UDP) port on the remote device. The default is 162.</td>
</tr>
</tbody>
</table>
Step 3

**Command**

```bash
snmp-server group groupname {v1 [auth | noauth | priv]} [read readview] [write writeview] [notify notifyview] [access access-list]
```

**Purpose**

Configure a new SNMP group on the remote device.

- For `groupname`, specify the name of the group.
- Specify a security model:
  - `v1` is the least secure of the possible security models.
  - `v2c` is the second least secure model. It allows transmission of informs and integers twice the normal width.
  - `v3`, the most secure, requires you to select an authentication level:
    - `auth`—Enables the Message Digest 5 (MD5) and the Secure Hash Algorithm (SHA) packet authentication.
    - `noauth`—Enables the noAuthNoPriv security level. This is the default if no keyword is specified.
    - `priv`—Enables Data Encryption Standard (DES) packet encryption (also called `privacy`).

**Note**

The `priv` keyword is available only when the cryptographic software image is installed.

- (Optional) Enter `read readview` with a string (not to exceed 64 characters) that is the name of the view in which you can only view the contents of the agent.
- (Optional) Enter `write writeview` with a string (not to exceed 64 characters) that is the name of the view in which you enter data and configure the contents of the agent.
- (Optional) Enter `notify notifyview` with a string (not to exceed 64 characters) that is the name of the view in which you specify a notify, inform, or trap.
- (Optional) Enter `access access-list` with a string (not to exceed 64 characters) that is the name of the access list.
Configuring SNMP Notifications

A trap manager is a management station that receives and processes traps. Traps are system alerts that the switch generates when certain events occur. By default, no trap manager is defined, and no traps are sent. Switches running this Cisco IOS release can have an unlimited number of trap managers.

Note
Many commands use the word traps in the command syntax. Unless there is an option in the command to select either traps or informs, the keyword traps refers to either traps, informs, or both. Use the snmp-server host global configuration command to specify whether to send SNMP notifications as traps or informs.

Table 27-4 describes the supported switch traps (notification types). You can enable any or all of these traps and configure a trap manager to receive them.

<table>
<thead>
<tr>
<th>Notification Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alarms</td>
<td>Generates SNMP alarm traps (Catalyst 2955 switch only).</td>
</tr>
<tr>
<td>bridge</td>
<td>Generates STP bridge MIB traps.</td>
</tr>
<tr>
<td>c2900</td>
<td>Generates a trap for Catalyst 2950- and Catalyst 2955-specific notifications.</td>
</tr>
</tbody>
</table>
You can use the `snmp-server host` global configuration command to a specific host to receive the notification types listed in Table 27-4.

Beginning in privileged EXEC mode, configure the switch to send traps or informs to a host:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>snmp-server engineID remote ip-address engineid-string</code></td>
<td>Specify the engine ID for the remote host.</td>
</tr>
</tbody>
</table>
Chapter 27 Configuring SNMP

### Command and Purpose

**Step 3**

```
snmp-server user username
groupname {remote host [udp-port port]} | v1 [access access-list] | v2c [access access-list] | v3 [encrypted] [access access-list] [auth {md5 | sha} auth-password]
```

Configure an SNMP user to be associated with the remote host created in Step 2.

**Note**

You cannot configure a remote user for an address without first configuring the engine ID for the remote host. Otherwise, you receive an error message, and the command is not executed.

**Step 4**

```
snmp-server group {groupname {v1 | v2c | v3 [auth | noauth | priv]}} [read readview] [write writeview] [notify notifyview] [access access-list]
```

Configure an SNMP group.

**Step 5**

```
snmp-server host host-addr [informs | traps] [version {1 | 2c | 3 [auth | noauth | priv]}] community-string [notification-type]
```

Specify the recipient of an SNMP trap operation.

- For `host-addr`, specify the name or Internet address of the host (the targeted recipient).
- (Optional) Enter `informs` to send SNMP informs to the host.
- (Optional) Enter `traps` (the default) to send SNMP traps to the host.
- (Optional) Specify the SNMP `version` (1, 2c, or 3). SNMPv1 is not available with informs.
- (Optional) For Version 3, select authentication level `auth`, `noauth`, or `priv`.

**Note**

The `priv` keyword is available only when the cryptographic software image is installed.

- For `community-string`, when `version 1` or `version 2c` is specified, enter the password-like community string sent with the notification operation. When `version 3` is specified, enter the SNMPv3 username.

**Note**

The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.

- (Optional) For `notification-type`, use the keywords listed in Table 27-4 on page 27-11. If no type is specified, all notifications are sent.

**Step 6**

```
snmp-server enable traps
notification-types
```

Enable the switch to send traps or informs and specify the type of notifications to be sent. For a list of notification types, see Table 27-4 on page 27-11, or enter this: `snmp-server enable traps ?`

To enable multiple types of traps, you must enter a separate `snmp-server enable traps` command for each trap type.

**Note**

When you configure a trap by using the notification type `port-security`, configure the port security trap first, and then configure the port security trap rate:

- `snmp-server enable traps port-security`
- `snmp-server enable traps port-security trap-rate rate`
Configuring SNMP

The `snmp-server host` command specifies which hosts receive the notifications. The `snmp-server enable trap` command globally enables the mechanism for the specified notification (for traps and informs). To enable a host to receive an inform, you must configure an `snmp-server host informs` command for the host and globally enable informs by using the `snmp-server enable traps` command.

To remove the specified host from receiving traps, use the `no snmp-server host` command with no keywords to disable traps, but not informs, to the host. To disable informs, use the `no snmp-server host informs` command. To disable a specific trap type, use the `no snmp-server enable traps notification-types` global configuration command.

### Setting the Agent Contact and Location Information

Beginning in privileged EXEC mode, follow these steps to set the system contact and location of the SNMP agent so that these descriptions can be accessed through the configuration file:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1   configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2   snmp-server contact text</td>
<td>Set the system contact string.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>snmp-server contact Dial System Operator at beeper 21555</code></td>
</tr>
<tr>
<td>Step 3   snmp-server location text</td>
<td>Set the system location string.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>snmp-server location Building 3/Room 222</code></td>
</tr>
<tr>
<td>Step 4   end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5   show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6   copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Limiting TFTP Servers Used Through SNMP

Beginning in privileged EXEC mode, follow these steps to limit the TFTP servers used for saving and loading configuration files through SNMP to the servers specified in an access list:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>snmp-server tftp-server-list access-list-number</td>
</tr>
<tr>
<td>Step 3</td>
<td>access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

SNMP Examples

This example shows how to enable all versions of SNMP. The configuration permits any SNMP manager to access all objects with read-only permissions using the community string public. This configuration does not cause the switch to send any traps.

Switch(config)# snmp-server community public

This example shows how to permit any SNMP manager to access all objects with read-only permission using the community string public. The switch also sends VTP traps to the hosts 192.180.1.111 and 192.180.1.33 using SNMPv1 and to the host 192.180.1.27 using SNMPv2C. The community string public is sent with the traps.

Switch(config)# snmp-server community public
Switch(config)# snmp-server enable traps vtp
Switch(config)# snmp-server host 192.180.1.27 version 2c public
Switch(config)# snmp-server host 192.180.1.111 version 1 public
Switch(config)# snmp-server host 192.180.1.33 public
This example shows how to allow read-only access for all objects to members of access list 4 that use the `comaccess` community string. No other SNMP managers have access to any objects. SNMP Authentication Failure traps are sent by SNMPv2C to the host `cisco.com` using the community string `public`.

```
Switch(config)# snmp-server community comaccess ro 4
Switch(config)# snmp-server enable traps snmp authentication
Switch(config)# snmp-server host cisco.com version 2c public
```

This example shows how to send Entity MIB traps to the host `cisco.com`. The community string is restricted. The first line enables the switch to send Entity MIB traps in addition to any traps previously enabled. The second line specifies the destination of these traps and overwrites any previous `snmp-server host` commands for the host `cisco.com`.

```
Switch(config)# snmp-server enable traps entity
Switch(config)# snmp-server host cisco.com restricted entity
```

This example shows how to enable the switch to send all traps to the host `myhost.cisco.com` using the community string `public`:

```
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com public
```

This example shows how to associate a user with a remote host and to send `auth` (authNoPriv) authentication-level informs when the user enters global configuration mode:

```
Switch(config)# snmp-server engineID remote 192.180.1.27 0000063000100a1c0b4011b
Switch(config)# snmp-server group authgroup v3 auth
Switch(config)# snmp-server user authuser authgroup remote 192.180.1.27 v3 auth md5 mypassword
Switch(config)# snmp-server user authuser authgroup v3 auth md5 mypassword
Switch(config)# snmp-server host 192.180.1.27 informs version 3 auth authuser config
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server inform retries 0
```

### Displaying SNMP Status

Displaying SNMP Status

To display SNMP input and output statistics, including the number of illegal community string entries, errors, and requested variables, use the `show snmp` privileged EXEC command. You also can use the other privileged EXEC commands in Table 27-5 to display SNMP information. For information about the fields in the displays, see the Cisco IOS Configuration Fundamentals Command Reference for Release 12.1

#### Table 27-5   Commands for Displaying SNMP Information

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show snmp</code></td>
<td>Displays SNMP statistics.</td>
</tr>
<tr>
<td>`show snmp engineID [local</td>
<td>remote]`</td>
</tr>
<tr>
<td><code>show snmp group</code></td>
<td>Displays information on each SNMP group on the network.</td>
</tr>
<tr>
<td><code>show snmp pending</code></td>
<td>Displays information on pending SNMP requests.</td>
</tr>
<tr>
<td><code>show snmp sessions</code></td>
<td>Displays information on the current SNMP sessions.</td>
</tr>
<tr>
<td><code>show snmp user</code></td>
<td>Displays information on each SNMP user name in the SNMP users table.</td>
</tr>
</tbody>
</table>
Configuring Network Security with ACLs

This chapter describes how to configure network security on a Catalyst 2950 or Catalyst 2955 switch by using access control lists (ACLs), which are also referred to in commands and tables as access lists.

You can create ACLs for physical interfaces or management interfaces. A management interface is defined as a management VLAN or any traffic that is going directly to the CPU, such as SNMP, Telnet, or web traffic. You can create ACLs for management interfaces with the standard software image (SI) or the enhanced software image (EI) installed on your switch. However, you must have the EI installed on your switch to apply ACLs to physical interfaces.

An ACLs that applied is to a physical interface has a limitation of one mask, and certain keywords are not supported. For more information, see the “Guidelines for Applying ACLs to Physical Interfaces” section on page 28-5.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the “Configuring IP Services” section of the Cisco IOS IP and IP Routing Configuration Guide, Cisco IOS Release 12.1 and the Cisco IOS IP and IP Routing Command Reference, Cisco IOS Release 12.1.

This chapter consists of these sections:

- Understanding ACLs, page 28-2
- Configuring ACLs, page 28-6
- Displaying ACL Information, page 28-20
- Examples for Compiling ACLs, page 28-22

You can configure ACLs by using the command-line interface (CLI).

You can also use the security wizard to filter inbound traffic on the switches. Filtering can be based on network addresses, TCP applications, or User Datagram Protocol (UDP) applications. You can choose whether to drop or to forward packets that meet the filtering criteria. To use this wizard, you must know how the network is designed and how interfaces are used on the filtering device. See the security wizard online help for step-by-step configuration procedures about using this wizard.
Understanding ACLs

Packet filtering can limit network traffic and restrict network use by certain users or devices. ACLs can filter traffic as it passes through a switch and permit or deny packets at specified interfaces. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. The switch tests the packet against the conditions in an access list one by one. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing conditions after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet.

You configure access lists on a Layer 2 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at switch interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic.

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies permit or deny and a set of conditions the packet must satisfy in order to match the ACE. The meaning of permit or deny depends on the context in which the ACL is used.

The switch supports these types of ACLs on physical interfaces in the inbound direction:

- IP ACLs filter IP, TCP, and UDP traffic.
- Ethernet or MAC ACLs filter Layer 2 traffic.
- MAC extended access lists use source and destination MAC addresses and optional protocol type information for matching operations.
- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

The switch examines access lists associated with features configured on a given interface. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined.
ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL. For example, you can use ACLs to allow one host to access a part of a network, but to prevent another host from accessing the same part. In Figure 28-1, ACLs applied at the switch input allow Host A to access the Human Resources network, but prevent Host B from accessing the same network.

**Figure 28-1 Using ACLs to Control Traffic to a Network**

Handling Fragmented and Unfragmented Traffic

IP packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, Internet Control Message Protocol (ICMP) type and code, and so on. All other fragments are missing this information.

Some ACEs do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IP packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- Permit ACEs that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.
- Deny ACEs that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.

Consider access list 102, configured with these commands, applied to three fragmented packets:

```
Switch (config)# access-list 102 permit tcp host 10.1.1.1 eq smtp
Switch (config)# access-list 102 deny tcp any host 10.1.1.2 eq telnet
Switch (config)# access-list 102 deny tcp any any
```
Understanding ACLs

Note

In the first and second ACEs in the examples, the eq keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

- Packet A is a TCP packet from host 10.2.2.2, port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit), as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information because the first ACE only checks Layer 3 information when applied to fragments. (The information in this example is that the packet is TCP and that the destination is 10.1.1.1.)

- Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information.

- Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and the resources of host 10.1.1.2 as it tries to reassemble the packet.

- Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the third ACE (a deny). All other fragments also match the third ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.

Understanding Access Control Parameters

Before configuring ACLs on the switches, you must have a thorough understanding of the access control parameters (ACPs). ACPs are referred to as masks in the switch CLI commands output.

Each ACE has a mask and a rule. The Classification Field or mask is the field of interest on which you want to perform an action. The specific values associated with a given mask are called rules.

Packets can be classified on these Layer 2, Layer 3, and Layer 4 fields:

- **Layer 2 fields:**
  - Source MAC address (Specify all 48 bits.)
  - Destination MAC address (Specify all 48 bits.)
  - Ethertype (16-bit ethertype field)

You can use any combination or all of these fields simultaneously to define a flow.

- **Layer 3 fields:**
  - IP source address (Specify all 32 IP source address bits to define the flow, or specify an user-defined subnet. There are no restrictions on the IP subnet to be specified.)
  - IP destination address (Specify all 32 IP destination address bits to define the flow, or specify an user-defined subnet. There are no restrictions on the IP subnet to be specified.)

You can use any combination or all of these fields simultaneously to define a flow.

- **Layer 4 fields:**
  - TCP (You can specify a TCP source, destination port number, or both at the same time.)
Chapter 28 Configuring Network Security with ACLs

Understanding ACLs

- UDP (You can specify a UDP source, destination port number, or both at the same time.)

A mask can be a combination of either multiple Layer 3 and Layer 4 fields or of multiple Layer 2 fields. Layer 2 fields cannot be combined with Layer 3 or Layer 4 fields.

There are two types of masks:

- User-defined mask—masks that are defined by the user.
- System-defined mask—these masks can be configured on any interface:

  ```
  Switch (config-ext-nacl)# permit tcp any any
  Switch (config-ext-nacl)# deny tcp any any
  Switch (config-ext-nacl)# permit udp any any
  Switch (config-ext-nacl)# deny udp any any
  Switch (config-ext-nacl)# permit ip any any
  Switch (config-ext-nacl)# deny ip any any
  Switch (config-ext-nacl)# permit any any
  ```

Note In an IP extended ACL (both named and numbered), a Layer 4 system-defined mask cannot precede a Layer 3 user-defined mask. For example, a Layer 4 system-defined mask such as `permit tcp any any` or `deny udp any any` cannot precede a Layer 3 user-defined mask such as `permit ip 10.1.1.1 any`. If you configure this combination, the ACL is not allowed on a Layer 2 interface. All other combinations of system-defined and user-defined masks are allowed in security ACLs.

The switch ACL configuration is consistent with other Cisco Catalyst switches. However, there are significant restrictions for configuring ACLs on the switches.

Only four user-defined masks can be defined for the entire system. These can be used for either security or quality of service (QoS) but cannot be shared by QoS and security. You can configure as many ACLs as you require. However, a system error message appears if ACLs with more than four different masks are applied to interfaces. For more information about error messages, see the system message guide for this release.

Table 28-1 lists a summary of the ACL restrictions on the switches.

<table>
<thead>
<tr>
<th>Restriction</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of user-defined masks allowed in an ACL</td>
<td>1</td>
</tr>
<tr>
<td>Number of ACLs allowed on an interface</td>
<td>1</td>
</tr>
<tr>
<td>Total number of user-defined masks for security and QoS allowed on a switch</td>
<td>4</td>
</tr>
</tbody>
</table>

Guidelines for Applying ACLs to Physical Interfaces

When applying ACLs to physical interfaces, follow these configuration guidelines:

- Only one ACL with these limitations can be attached to an interface:
  - Gigabit Ethernet ports support up to 100 ACEs per 1 ACL per port.
Chapter 28 Configuring Network Security with ACLs

Configuring ACLs

- Fast Ethernet ports support up to 75 ACEs per 1 ACL across a range of 8 Fast Ethernet ports. This means that ports 1 to 8 support a combined total of 75 ACEs, ports 9 to 16 support a combined total of 75 ACEs, and so on.

If you exceed the limit of ACEs over the range of ports, the switch will return an Error: Out of Rule Resources message.

For more information, see the `ip access-group` interface command in the command reference for this release.

- All ACEs in an ACL must have the same user-defined mask. However, ACEs can have different rules that use the same mask. On a given interface, only one type of user-defined mask is allowed, but you can apply any number of system-defined masks. For more information on system-defined masks, see the “Understanding Access Control Parameters” section on page 28-4.

This example shows the same mask in an ACL:

```
Switch (config)# ip access-list extended acl2
Switch (config-ext-nacl)# permit tcp 10.1.1.1 0.0.0.0 any eq 80
Switch (config-ext-nacl)# permit tcp 20.1.1.1 0.0.0.0 any eq 23
```

In this example, the first ACE permits all the TCP packets coming from host 10.1.1.1 with a destination TCP port number of 80. The second ACE permits all TCP packets coming from host 20.1.1.1 with a destination TCP port number of 23. Both the ACEs use the same mask; therefore, a switch supports this ACL.

- When you apply an ACL to a physical interface, some keywords are not supported and certain mask restrictions apply to the ACLs. See the “Creating a Numbered Standard ACL” section on page 28-8 and the “Creating a Numbered Extended ACL” section on page 28-10 for creating these ACLs.

Note: You can also apply ACLs to a management interface without the above limitations. For information, see the “Configuring IP Services” section of the Cisco IOS IP and IP Routing Configuration Guide, Cisco IOS Release 12.1 and the Cisco IOS IP and IP Routing Command Reference, Cisco IOS Release 12.1.

Configuring ACLs

This section includes these topics:

- “Unsupported Features” section on page 28-7
- “Creating Standard and Extended IP ACLs” section on page 28-7
- “Creating Named MAC Extended ACLs” section on page 28-17
- “Creating MAC Access Groups” section on page 28-18

Configuring ACLs on a Layer 2 interface is the same as configuring ACLs on Cisco routers. The process is briefly described here. For more detailed information about configuring router ACLs, see the “Configuring IP Services” chapter in the Cisco IP and IP Routing Configuration Guide, Cisco IOS Release 12.1. For detailed information about the commands, see the Cisco IOS IP and IP Routing Command Reference, Cisco IOS Release 12.1. For a list of Cisco IOS features not supported on the switch, see the “Unsupported Features” section on page 28-7.
Unsupported Features

The switch does not support these Cisco IOS router ACL-related features:

- Non-IP protocol ACLs (see Table 28-2 on page 28-8)
- Bridge-group ACLs
- IP accounting
- ACL support on the outbound direction
- Inbound and outbound rate limiting (except with QoS ACLs)
- IP packets that have a header length of less than 5 bytes
- Reflexive ACLs
- Dynamic ACLs (except for certain specialized dynamic ACLs used by the switch clustering feature)
- ICMP-based filtering
- Interior Gateway Routing Protocol (IGMP)-based filtering

Creating Standard and Extended IP ACLs

This section describes how to create switch IP ACLs. The switch tests packets against the conditions in an access list one by one. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing conditions after the first match, the order of the conditions is critical. If no conditions match, the switch denies the packet.

Follow these steps to use ACLs:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create an ACL by specifying an access list number or name and access conditions.</td>
</tr>
<tr>
<td>2</td>
<td>Apply the ACL to interfaces or terminal lines.</td>
</tr>
</tbody>
</table>

The software supports these kinds of IP access lists:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses for matching operations and optional protocol-type information for finer granularity of control.

**Note**

MAC extended access list use source and destination MAC addresses and optional protocol type information for matching operations. For more information, see the “Creating Named MAC Extended ACLs” section on page 28-17.

The next sections describe access lists and the steps for using them.

ACL Numbers

The number you use to denote your ACL shows the type of access list that you are creating. Table 28-2 lists the access list number and corresponding type and shows whether or not they are supported by the switch. The switch supports IP standard and IP extended access lists, numbers 1 to 199 and 1300 to 2699.
Configuring ACLs

Table 28-2 Access List Numbers

<table>
<thead>
<tr>
<th>ACL Number</th>
<th>Type</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>1–99</td>

<tr>
<td>800–899</td>
<td>IPX standard access list</td>
<td>No</td>
</tr>
<tr>
<td>900–999</td>
<td>IPX extended access list</td>
<td>No</td>
</tr>
<tr>
<td>1000–1099</td>
<td>IPX SAP access list</td>
<td>No</td>
</tr>
<tr>
<td>1100–1199</td>
<td>Extended 48-bit MAC address access list</td>
<td>No</td>
</tr>
<tr>
<td>1200–1299</td>
<td>IPX summary address access list</td>
<td>No</td>
</tr>
<tr>
<td>1300–1999</td>
<td>IP standard access list (expanded range)</td>
<td>Yes</td>
</tr>
<tr>
<td>2000–2699</td>
<td>IP extended access list (expanded range)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Note In addition to numbered standard and extended ACLs, you can also create named standard and extended IP ACLs by using the supported numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Creating a Numbered Standard ACL

Note For information about creating ACLs to apply to a management interface, see the "Configuring IP Services" section of the Cisco IOS IP and IP Routing Configuration Guide, Cisco IOS Release 12.1 and the Cisco IOS IP and IP Routing Command Reference, Cisco IOS Release 12.1. You can these apply these ACLs only to a management interface.
Beginning in privileged EXEC mode, follow these steps to create a numbered standard IP ACL:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| 2    | access-list access-list-number {deny | permit | remark} {source source-wildcard | host source | any} | Define a standard IP ACL by using a source address and wildcard. The access-list-number is a decimal number from 1 to 99 or 1300 to 1999. Enter deny or permit to specify whether to deny or permit access if conditions are matched. The source is the source address of the network or host from which the packet is being sent:  
- The 32-bit quantity in dotted-decimal format.  
- The keyword any as an abbreviation for source and source-wildcard of 0.0.0.0 255.255.255.255. You do not need to enter a source wildcard.  
- The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0. (Optional) The source-wildcard applies wildcard bits to the source. (See first bullet item.) |
| 3    | end | Return to privileged EXEC mode. |
| 4    | show access-lists [number | name] | Show the access list configuration. |
| 5    | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

Use the no access-list access-list-number global configuration command to delete the entire ACL. You cannot delete individual ACEs from numbered access lists.

When creating an ACL, remember that, by default, the end of the ACL contains an implicit deny statement for all packets that it did not find a match for before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.

This example shows how to create a standard ACL to deny access to IP host 171.69.198.102, permit access to any others, and display the results.

```plaintext
Switch (config)# access-list 2 deny host 171.69.198.102
Switch (config)# access-list 2 deny host
Switch (config)# end
Switch# show access-lists
Standard IP access list 2
  deny   171.69.198.102
  permit any
```
Creating a Numbered Extended ACL

Although standard ACLs use only source addresses for matching, you can use an extended ACL source and destination addresses for matching operations and optional protocol type information for finer granularity of control. Some protocols also have specific parameters and keywords that apply to that protocol.

These IP protocols are supported on physical interfaces (protocol keywords are in parentheses in bold): Internet Protocol (ip), Transmission Control Protocol (tcp), or User Datagram Protocol (udp).

Supported parameters can be grouped into these categories:

- TCP
- UDP

Table 28-3 lists the possible filtering parameters for ACEs for each protocol type.

<table>
<thead>
<tr>
<th>Table 28-3 Filtering Parameter ACEs Supported by Different IP Protocols</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filtering Parameter</td>
</tr>
<tr>
<td><strong>Layer 3 Parameters:</strong></td>
</tr>
<tr>
<td>IP type of service (ToS) byte</td>
</tr>
<tr>
<td>Differentiated Services Code Point (DSCP)</td>
</tr>
<tr>
<td>IP source address</td>
</tr>
<tr>
<td>IP destination address</td>
</tr>
<tr>
<td>Fragments</td>
</tr>
<tr>
<td>TCP or UDP</td>
</tr>
<tr>
<td><strong>Layer 4 Parameters:</strong></td>
</tr>
<tr>
<td>Source port operator</td>
</tr>
<tr>
<td>Source port</td>
</tr>
<tr>
<td>Destination port operator</td>
</tr>
<tr>
<td>Destination port</td>
</tr>
<tr>
<td>TCP flag</td>
</tr>
</tbody>
</table>

1. X in a protocol column means support for the filtering parameter.
2. No support for type of service (ToS) minimize monetary cost bit.

For more details about the specific keywords relative to each protocol, see the Cisco IP and IP Routing Command Reference, Cisco IOS Release 12.1.

**Note**

The switch does not support dynamic or reflexive access lists. It also does not support filtering based on the minimize-monetary-cost type of service (ToS) bit.

When creating ACEs in numbered extended access lists, remember that after you create the list, any additions are placed at the end of the list. You cannot reorder the list or selectively add or remove ACEs from a numbered list.
### Configuring ACLs

**Note**

For information about creating ACLs to apply to management interfaces, see the “Configuring IP Services” section ofCisco IOS IP and IP Routing Configuration Guide, Release 12.1and theCisco IOS IP and IP Routing Command Reference, Cisco IOS Release 12.1. You can apply ACLs only to a management interface or the CPU, such as SNMP, Telnet, or web traffic.

Beginning in privileged EXEC mode, follow these steps to create an extended ACL:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>access-list access-list-number [deny</td>
</tr>
<tr>
<td></td>
<td>[host destination</td>
</tr>
</tbody>
</table>

- The operator can be only eq (equal).
- If operator is after source source-wildcard, conditions match when the source port matches the defined port.
- If operator is after destination destination-wildcard, conditions match when the destination port matches the defined port.
- The port is a decimal number or name of a TCP or UDP port. The number can be from 0 to 65535.
- Use TCP port names only for TCP traffic.
- Use UDP port names only for UDP traffic.
- The destination-wildcard applies wildcard bits to the destination.
Chapter 28  Configuring Network Security with ACLs

Configuring ACLs

Use the `no access-list access-list-number` global configuration command to delete the entire access list. You cannot delete individual ACEs from numbered access lists.

This example shows how to create and display an extended access list to deny Telnet access from any host in network 171.69.198.0 to any host in network 172.20.52.0 and permit any others. (The `eq` keyword after the destination address means to test for the TCP destination port number equaling Telnet.)

```
Switch(config)# access-list 102 deny tcp 171.69.198.0 0.0.0.255 172.20.52.0 0.0.0.255 eq telnet
Switch(config)# access-list 102 permit tcp any any
Switch(config)# end
Switch# show access-lists
Extended IP access list 102
  deny tcp 171.69.198.0 0.0.0.255 172.20.52.0 0.0.0.255 eq telnet
  permit tcp any any
```

After an ACL is created, any additions (possibly entered from the terminal) are placed at the end of the list. You can add ACEs to an ACL, but deleting any ACE deletes the entire ACL.

**Note**

When creating an ACL, remember that, by default, the end of the access list contains an implicit deny statement for all packets if the access list does not find a match before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.

After creating an ACL, you must apply it to a line or interface, as described in the “Applying ACLs to Terminal Lines or Physical Interfaces” section on page 28-19.
Creating Named Standard and Extended ACLs

You can identify IP ACLs with an alphanumeric string (a name) rather than a number. You can use named ACLs to configure more IP access lists on a switch than if you use numbered access lists. If you identify your access list with a name rather than a number, the mode and command syntax are slightly different. However, not all commands that use IP access lists accept a named ACL.

The name you give to a standard ACL or extended ACL can also be a number in the supported range of access list numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Consider these guidelines and limitations before configuring named ACLs:

- A standard ACL and an extended ACL cannot have the same name.
- Numbered ACLs are also available, as described in the “Creating Standard and Extended IP ACLs” section on page 28-7.

Beginning in privileged EXEC mode, follow these steps to create a standard named access list using names:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>ip access-list standard {name</td>
<td>access-list-number}</td>
</tr>
<tr>
<td>deny {source source-wildcard</td>
<td>host source</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show access-lists [number</td>
<td>name]</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Beginning in privileged EXEC mode, follow these steps to create an extended named ACL using names:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>ip access-list extended {name</td>
<td>access-list-number}</td>
</tr>
<tr>
<td>Step 4</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Show the access list configuration.</td>
</tr>
<tr>
<td>Step 6</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
When making the standard and extended ACL, remember that, by default, the end of the ACL contains an implicit deny statement for everything if it did not find a match before reaching the end. For standard ACLs, if you omit the mask from an associated IP host address access list specification, 0.0.0.0 is assumed to be the mask.

After you create an ACL, any additions are placed at the end of the list. You cannot selectively add ACEs to a specific ACL. However, you can use no permit and no deny commands to remove ACEs from a named ACL. This example shows how you can delete individual ACEs from a named ACL:

```
Switch(config)# ip access-list extended border-list
Switch(config-ext-nacl)# no permit ip host 10.1.1.3 any
```

Being able to selectively remove lines from a named ACL is one reason you might use named ACLs instead of numbered ACLs.

After creating an ACL, you must apply it to a line or interface, as described in the “Applying ACLs to Terminal Lines or Physical Interfaces” section on page 28-19.

### Applying Time Ranges to ACLs

You can implement extended ACLs based on the time of day and week by using the `time-range` global configuration command. First, define the name and times of the day and week of the time range, and then reference the time range by name in an ACL to apply restrictions to the access list. You can use the time range to define when the permit or deny statements in the ACL are in effect. The `time-range` keyword and argument are referenced in the named and numbered extended ACL task tables in the “Creating Standard and Extended IP ACLs” section on page 28-7, and the “Creating Named Standard and Extended ACLs” section on page 28-13.

These are some of the many benefits of using time ranges:

- You have more control over permitting or denying a user access to resources, such as an application (identified by an IP address mask pair and a port number).
You can control logging messages. ACL entries can log traffic at certain times of the day, but not constantly. Therefore, you can simply deny access without having to analyze many logs generated during peak hours.

**Note**

The time range relies on the switch system clock. Therefore, you need a reliable clock source. We recommend that you use Network Time Protocol (NTP) to synchronize the switch clock. For more information, see the “Managing the System Time and Date” section on page 7-1.

Beginning in privileged EXEC mode, follow these steps to configure a time-range parameter for an ACL:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>time-range time-range-name</td>
<td>Identify the time-range by a meaningful name (for example, workhours), and enter time-range configuration mode. The name cannot contain a space or quotation mark and must begin with a letter.</td>
</tr>
<tr>
<td>Step 4</td>
<td>absolute [start time date] [end time date]</td>
<td>Specify when the function it will be applied to is operational. Use some combination of these commands; multiple periodic statements are allowed; only one absolute statement is allowed. If more than one absolute statement is configured, only the one configured last is executed.</td>
</tr>
<tr>
<td></td>
<td>periodic day-of-the-week hh:mm to [day-of-the-week] hh:mm</td>
<td></td>
</tr>
<tr>
<td></td>
<td>periodic { weekdays</td>
<td>weekend</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>show time-range</td>
<td>Verify the time-range configuration.</td>
</tr>
<tr>
<td></td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove a configured time-range, use the **no time-range time-range-name** global configuration command.

Repeat the steps if you have multiple items that you want operational at different times.

This example shows how to configure time ranges for *workhours* and for company holidays and how to verify your configuration.

```
Switch(config)# time-range workhours
Switch(config-time-range)# periodic weekdays 8:00 to 12:00
Switch(config-time-range)# periodic weekdays 13:00 to 17:00
Switch(config-time-range)# exit
Switch(config)# time-range new_year_day_2000
Switch(config-time-range)# absolute start 00:00 1 Jan 2000 end 23:59 1 Jan 2000
Switch(config-time-range)# exit
Switch(config)# time-range thanksgiving_2000
Switch(config-time-range)# absolute start 00:00 22 Nov 2000 end 23:59 23 Nov 2000
Switch(config-time-range)# exit
Switch(config)# time-range christmas_2000
Switch(config-time-range)# absolute start 00:00 24 Dec 2000 end 23:50 25 Dec 2000
Switch(config-time-range)# end
Switch# show time-range
time-range entry: christmas_2000 (inactive)
  absolute start 00:00 24 December 2000 end 23:50 25 December 2000
```
Chapter 28  Configuring Network Security with ACLs

Configuring ACLs

time-range entry: new_year_day_2000 (inactive)
   absolute start 00:00 01 January 2000 end 23:59 01 January 2000

time-range entry: thanksgiving_2000 (inactive)
   absolute start 00:00 22 November 2000 end 23:59 23 November 2000

time-range entry: workhours (inactive)
   periodic weekdays 8:00 to 12:00
   periodic weekdays 13:00 to 17:00

To apply a time range, you must reference it by name (for example, workhours) in an extended ACL that can implement time ranges. This example shows how to create and verify extended access list 188 that denies TCP traffic from any source to any destination during the defined holiday time ranges and permits all TCP traffic during work hours.

Switch(config)# access-list 188 deny tcp any any time-range new_year_day_2000
Switch(config)# access-list 188 deny tcp any any time-range thanksgiving_2000
Switch(config)# access-list 188 deny tcp any any time-range christmas_2000
Switch(config)# access-list 188 permit tcp any any time-range workhours
Switch(config)# end
Switch# show access-lists
Extended IP access list 188
   deny tcp any any time-range new_year_day_2000 (inactive)
   deny tcp any any time-range thanksgiving_2000 (active)
   deny tcp any any time-range christmas_2000 (inactive)
   permit tcp any any time-range workhours (inactive)

This example uses named ACLs to permit and deny the same traffic.

Switch(config)# ip access-list extended deny_access
Switch(config-ext-nacl)# deny tcp any any time-range new_year_day_2000
Switch(config-ext-nacl)# deny tcp any any time-range thanksgiving_2000
Switch(config-ext-nacl)# deny tcp any any time-range christmas_2000
Switch(config-ext-nacl)# exit
Switch(config)# ip access-list extended may_access
Switch(config-ext-nacl)# permit tcp any any time-range workhours
Switch(config-ext-nacl)# end
Switch# show ip access-lists
Extended IP access list deny_access
   deny tcp any any time-range new_year_day_2000 (inactive)
   deny tcp any any time-range thanksgiving_2000 (inactive)
   deny tcp any any time-range christmas_2000 (inactive)
Extended IP access list may_access
   permit tcp any any time-range workhours (inactive)

Including Comments About Entries in ACLs

You can use the remark command to include comments (remarks) about entries in any IP standard or extended ACL. The remarks make the ACL easier for you to understand and scan. Each remark line is limited to 100 characters.

The remark can go before or after a permit or deny statement. You should be consistent about where you put the remark so that it is clear which remark describes which permit or deny statement. For example, it would be confusing to have some remarks before the associated permit or deny statements and some remarks after the associated statements.

For IP numbered standard or extended ACLs, use the access-list access-list number remark remark global configuration command to include a comment about an access list. To remove the remark, use the no form of this command.

In this example, the workstation belonging to Jones is allowed access, and the workstation belonging to Smith is not allowed access:

Switch(config)# access-list 1 remark Permit only Jones workstation through
Chapter 28  Configuring Network Security with ACLs

Configuring ACLs

```
Switch(config)# access-list 1 permit 171.69.2.88
Switch(config)# access-list 1 remark Do not allow Smith workstation through
Switch(config)# access-list 1 deny 171.69.3.13
```

For an entry in a named IP ACL, use the `remark` access-list global configuration command. To remove the remark, use the no form of this command.

In this example, the Jones subnet is not allowed to use outbound Telnet:

```
Switch(config)# ip access-list extended telnetting
Switch(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Switch(config-ext-nacl)# deny tcp host 171.69.2.88 any eq telnet
```

Creating Named MAC Extended ACLs

You can filter Layer 2 traffic on a physical Layer 2 interface by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named access lists.

```
Note
Named MAC extended ACLs are used as a part of the mac access-group privileged EXEC command.
```

For more information about the supported non-IP protocols in the `mac access-list extended` command, see the command reference for this release.

```
Note
Matching on any SNAP-encapsulated packet with a nonzero Organizational Unique Identifier (OUI) is not supported.
```

Beginning in privileged EXEC mode, follow these steps to create a named MAC extended ACL:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 mac access-list extended name</td>
<td>Define an extended MAC access list by using a name.</td>
</tr>
<tr>
<td>Step 3 deny</td>
<td>any</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show access-lists [number</td>
<td>name]</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no mac access-list extended name` global configuration command to delete the entire ACL. You can also delete individual ACEs from named MAC extended ACLs.
Chapter 28 Configuring Network Security with ACLs

Configuring ACLs

This example shows how to create and display an access list named `mac1`, denying only EtherType DECnet Phase IV traffic, but permitting all other types of traffic.

```
Switch(config)# mac access-list extended mac1
Switch(config-ext-macl)# deny any any decnet-iv
Switch(config-ext-macl)# permit any any
Switch(config-ext-macl)# end
Switch # show access-list
```

Extended MAC access list mac1
 deny any any decnet-iv
 permit any any

Creating MAC Access Groups

Beginning in privileged EXEC mode, follow these steps to create MAC access groups and to apply a MAC access list to an interface:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
<td>Identify a specific interface for configuration, and enter interface configuration mode. The interface must be a Layer 2 interface.</td>
</tr>
<tr>
<td>3</td>
<td>mac access-group {name} {in}</td>
<td>Control access to the specified interface by using the MAC access list name.</td>
</tr>
<tr>
<td>4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>5</td>
<td>show mac-access group</td>
<td>Display the MAC ACLs applied on the switch.</td>
</tr>
<tr>
<td>6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to apply ACL 2 on an interface to filter packets entering the interface:

```
Switch(config)# interface gigabitethernet0/1
Router(config-if)# mac access-group 2 in
```

Note

The `mac access-group` interface configuration command is only valid when applied to a Layer 2 interface.

For inbound ACLs, after receiving a packet, the switch checks the packet against the ACL. If the ACL permits the packet, the switch continues to process the packet. If the ACL rejects the packet, the switch discards the packet. The MAC ACL applies to both IP and non-IP packets.

When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied to the interface and permits all packets. Remember this behavior if you use undefined ACLs as a means of network security.
Applying ACLs to Terminal Lines or Physical Interfaces

Note: Before applying an ACL to a physical interface, see the “Guidelines for Applying ACLs to Physical Interfaces” section on page 28-5.

You can apply ACLs to any management interface. For information on creating ACLs on management interfaces, see the “Configuring IP Services” section of the Cisco IOS IP and IP Routing Configuration Guide, Cisco IOS Release 12.1 and the Cisco IOS IP and IP Routing Command Reference, Cisco IOS Release 12.1.

Note: The limitations that apply to ACLs on physical interfaces do not apply to ACLs on management interfaces.

After you create an ACL, you can apply it to one or more management interfaces or terminal lines. ACLs can be applied on inbound interfaces. This section describes how to accomplish this task for both terminal lines and network interfaces. Note these guidelines:

- When controlling access to a line, you must use numbered IP ACLs or MAC extended ACLs.
- When controlling access to an interface, you can use named or numbered ACLs.
- Set identical restrictions on all the virtual terminal lines because a user can attempt to connect to any of them.
- If you apply ACLs to a management interface, the ACL only filters packets that are intended for the CPU, such as SNMP, Telnet, or web traffic.

Applying ACLs to a Terminal Line

Beginning in privileged EXEC mode, follow these steps to restrict incoming connections between a virtual terminal line and the addresses in an ACL:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>line [console</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>access-class access-list-number [in]</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
Applying ACLs to a Physical Interface

Beginning in privileged EXEC mode, follow these steps to control access to a Layer 2 interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Identify a specific interface for configuration and enter interface configuration mode. The interface must be a Layer 2 or management interface or a management interface VLAN ID.</td>
</tr>
<tr>
<td>ip access-group {access-list-number \ pace-list-name} {in}</td>
<td>Control access to the specified interface.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Display the access list configuration.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to apply access list 2 on an interface to filter packets entering the interface:

```
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# ip access-group 2 in
```

Note

The `ip access-group` interface configuration command is only valid when applied to a management interface or a Layer 2 physical interface. ACLs cannot be applied to interface port-channels.

For inbound ACLs, after receiving a packet, the switch checks the packet against the ACL. If the ACL permits the packet, the switch continues to process the packet. If the ACL rejects the packet, the switch discards the packet.

When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied to the interface and permits all packets. Remember this behavior if you use undefined ACLs for network security.

Displaying ACL Information

You can display the ACLs that are configured on the switch, and you can display the ACLs that have been applied to physical and management interfaces. This section consists of these topics:

- Displaying ACLs, page 28-20
- Displaying Access Groups, page 28-21

Displaying ACLs

You can display existing ACLs by using `show` commands.
Beginning in privileged EXEC mode, follow these steps to display access lists:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| `show access-lists [number | name]` | Show information about all IP and MAC address access lists or about a specific access list (numbered or named). |
| **Step 2**
| `show ip access-list [number | name]` | Show information about all IP address access lists or about a specific IP ACL (numbered or named). |

This example shows all standard and extended ACLs:

```plaintext
Switch# show access-lists
Standard IP access list 1
 permit 172.20.10.10
Standard IP ACL 10
 permit 12.12.12.12
Standard IP access list 12
 deny 1.3.3.2
Standard IP access list 32
 permit 172.20.20.20
Standard IP access list 34
 permit 10.24.35.36
 permit 23.45.56.34
Extended IP access list 120
Extended MAC access list mac1
```

This example shows only IP standard and extended ACLs.

```plaintext
Switch# show ip access-lists
Standard IP access list 1
 permit 172.20.10.10
Standard IP access list 10
 permit 12.12.12.12
Standard IP access list 12
 deny 1.3.3.2
Standard IP access list 32
 permit 172.20.20.20
Standard IP access list 34
 permit 10.24.35.36
 permit 23.45.56.34
Extended IP access list 120
```

### Displaying Access Groups

This feature is available only if your switch is running the EI.

You use the `ip access-group` interface configuration command to apply ACLs to a Layer 3 interface. When IP is enabled on an interface, you can use the `show ip interface interface-id` privileged EXEC command to view the input and output access lists on the interface, as well as other interface characteristics. If IP is not enabled on the interface, the access lists are not shown.

This example shows how to view all access groups configured for VLAN 1:

```plaintext
Switch# show ip interface vlan 1
Vlan1 is up, line protocol is up
 Internet address is 10.20.30.1/16
 Broadcast address is 255.255.255.255
```
Address determined by setup command
MTU is 1500 bytes
Helper address is not set
Directed broadcast forwarding is disabled
Outgoing access list is permit Any
Inbound access list is 13
<information truncated>

This example shows how to view all access groups configured for an interface:

Switch# show ip interface fastethernet0/9
FastEthernet0/9 is down, line protocol is down
  Inbound access list is ip1

The only way to ensure that you can view all configured access groups under all circumstances is to use the show running-config privileged EXEC command. To display the ACL configuration of a single interface, use the show running-config interface interface-id command.

This example shows how to display the ACL configuration of Gigabit Ethernet interface 0/1:

Switch# show running-config interface gigabitethernet0/1
Building configuration...

Current configuration :112 bytes
!
interface GigabitEthernet0/1
 ip access-group 11 in
snmp trap link-status
no cdp enable
end!

Examples for Compiling ACLs

For detailed information about compiling ACLs, see the Security Configuration Guide and the “IP Services” chapter of the Cisco IOS IP and IP Routing Configuration Guide, Cisco IOS Release 12.1.

Figure 28-2 shows a small networked office with a number of switches that are connected to a Cisco router. A host is connected to the network through the Internet using a WAN link.

Use switch ACLs to do these:

- Create a standard ACL, and filter traffic from a specific Internet host with an address 172.20.128.64.
- Create an extended ACL, and filter traffic to deny HTTP access to all Internet hosts but allow all other types of access.
This example uses a standard ACL to allow access to a specific Internet host with the address 172.20.128.64.

```
Switch(config)# access-list 6 permit 172.20.128.64 0.0.0.0
Switch(config)# end
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip access-group 6 in
```

This example uses an extended ACL to deny traffic from port 80 (HTTP). It permits all other types of traffic.

```
Switch(config)# access-list 106 deny tcp any any eq 80
Switch(config)# access-list 106 permit ip any any
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# ip access-group 106 in
```
Numbered ACL Examples

This example shows that the switch accepts addresses on network 36.0.0.0 subnets and denies all packets coming from 56.0.0.0 subnets. The ACL is then applied to packets entering an interface.

```plaintext
Switch(config)# access-list 2 permit 36.0.0.0 0.255.255.255
Switch(config)# access-list 2 deny 56.0.0.0 0.255.255.255
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip access-group 2 in
```

Extended ACL Examples

In this example of using an extended ACL, you have a network connected to the Internet, and you want any host on the network to be able to form TCP Telnet and SMTP connections to any host on the Internet.

```plaintext
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 23
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 25
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip access-group 102 in
```

SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same port numbers are used throughout the life of the connection. Mail packets coming in from the Internet have a destination port of 25. Because the secure system behind the switch always accepts mail connections on port 25, the incoming services are controlled.

Named ACL Example

The Marketing_group ACL allows any TCP Telnet traffic to the destination address and wildcard 171.69.0.0 0.0.255.255 and denies any other TCP traffic. It permits any other IP traffic.

```plaintext
Switch(config)# ip access-list extended marketing_group
Switch(config-ext-nacl)# permit tcp any 171.69.0.0 0.0.255.255 eq telnet
Switch(config-ext-nacl)# deny tcp any any
Switch(config-ext-nacl)# permit ip any any
```

The ACLs are applied to permit a port with the Marketing_group ACL applied to incoming traffic.

```plaintext
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip access-group marketing_group in
```

Commented IP ACL Entry Examples

In this example of a numbered ACL, the workstation belonging to Jones is allowed access, and the workstation belonging to Smith is not allowed access:

```plaintext
Switch(config)# access-list 1 remark Permit only Jones workstation through
Switch(config)# access-list 1 permit 171.69.2.88
Switch(config)# access-list 1 remark Do not allow Smith workstation through
Switch(config)# access-list 1 deny 171.69.3.13
```

In this example of a numbered ACL, the Winter and Smith workstations are not allowed to browse the web:

```plaintext
Switch(config)# access-list 100 remark Do not allow Winter to browse the web
```
Switch(config)# access-list 100 deny host 171.69.3.85 any eq www
Switch(config)# access-list 100 remark Do not allow Smith to browse the web
Switch(config)# access-list 100 deny host 171.69.3.13 any eq www

In this example of a named ACL, the Jones subnet is not allowed access:
Switch(config)# ip access-list standard prevention
Switch(config-std-nacl)# remark Do not allow Jones subnet through
Switch(config-std-nacl)# deny 171.69.0.0 0.0.255.255

In this example of a named ACL, the Jones subnet is not allowed to use outbound Telnet:
Switch(config)# ip access-list extended telnetting
Switch(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Switch(config-ext-nacl)# deny tcp 171.69.0.0 0.0.255.255 any eq telnet
Examples for Compiling ACLs
Configuring QoS

This chapter describes how to configure quality of service (QoS) by using automatic-QoS (auto-QoS) commands or by using standard QoS commands. With QoS, you can give preferential treatment to certain types of traffic at the expense of others. Without QoS, the Catalyst 2950 or Catalyst 2955 switch offers best-effort service to each packet, regardless of the packet contents or size. It sends the packets without any assurance of reliability, delay bounds, or throughput.

To use the features described in this chapter, you must have the enhanced software image (EI) installed on your switch.

If you have the standard software image (SI) installed on your switch, you cannot configure some of the features. Table 29-1 lists the sections that describe the features that you can configure.

Note: For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

The switch supports some of the modular QoS CLI (MQC) commands. For more information about the MQC commands, see the “Modular Quality of Service Command Line Interface Overview” at this URL: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/products_configuration_guide_chapter09186a00800b909.html

QoS can be configured either by using Network Assistant or the command-line interface (CLI). See the Network Assistant online help for configuration procedures.
You can also use these wizards to configure QoS only if your switch is running the EI:

- **Priority data wizard**—Lets you assign priority levels to data applications based on their TCP or UDP ports. It has a standard list of applications, and you select the ones that you want to prioritize, the priority levels, and the interfaces where the prioritization occurs. See the priority data wizard online help for procedures about using this wizard.

- **Video wizard**—Gives traffic that originates from specified video servers a higher priority than the priority of data traffic. The wizard assumes that the video servers are connected to a single device in the cluster. See the video wizard online help for procedures about using this wizard.

This chapter consists of these sections:

- Configuring Auto-QoS, page 29-9
- Displaying Auto-QoS Information, page 29-14
- Auto-QoS Configuration Example, page 29-14
- Configuring Standard QoS, page 29-16
- Displaying Standard QoS Information, page 29-36
- Standard QoS Configuration Examples, page 29-37

## Understanding QoS

This section describes how QoS is implemented on the switch. If you have the SI installed on your switch, some concepts and features in this section might not apply. For a list of available features, see Table 29-1 on page 29-1.

Typically, networks operate on a best-effort delivery basis, which means that all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped.

When you configure the QoS feature, you can select specific network traffic, prioritize it according to its relative importance, and use congestion-management and congestion-avoidance techniques to give preferential treatment. Implementing QoS in your network makes network performance more predictable and bandwidth utilization more effective.

The QoS implementation is based on the DiffServ architecture, an emerging standard from the Internet Engineering Task Force (IETF). This architecture specifies that each packet is classified upon entry into the network. The classification is carried in the IP packet header, using 6 bits from the deprecated IP type-of-service (ToS) field to carry the classification (class) information.

Classification can also be carried in the Layer 2 frame. These special bits in the Layer 2 frame or a Layer 3 packet are described here and shown in Figure 29-1:

- Prioritization values in Layer 2 frames
  
  Layer 2 IEEE 802.1Q frame headers have a 2-byte Tag Control Information field that carries the class of service (CoS) value in the three most-significant bits, which are called the User Priority bits. On interfaces configured as Layer 2 IEEE 802.1Q trunks, all traffic is in IEEE 802.1Q frames except for traffic in the native VLAN.

  Other frame types cannot carry Layer 2 CoS values.

  Layer 2 CoS values range from 0 for low priority to 7 for high priority.

- Prioritization bits in Layer 3 packets
Layer 3 IP packets can carry a Differentiated Services Code Point (DSCP) value. The supported DSCP values are 0, 8, 10, 16, 24, 26, 32, 34, 40, 46, 48, and 56.

All switches and routers that access the Internet rely on the class information to give the same forwarding treatment to packets with the same class information and different treatment to packets with different class information. The class information in the packet can be assigned by end hosts or by switches or routers along the way, based on a configured policy, detailed examination of the packet, or both. Detailed examination of the packet is expected to happen closer to the edge of the network so that the core switches and routers are not overloaded.

Switches and routers along the path can use the class information to limit the amount of resources allocated per traffic class. The behavior of an individual device when handling traffic in the DiffServ architecture is called per-hop behavior. If all devices along a path have a consistent per-hop behavior, you can construct an end-to-end QoS solution.

Implementing QoS in your network can be a simple or complex task and depends on the QoS features offered by your internetworking devices, the traffic types and patterns in your network, and the granularity of control that you need over incoming and outgoing traffic.

**Basic QoS Model**

*Figure 29-2* shows the basic QoS model. Actions at the ingress interface include classifying traffic, policing, and marking:

- Classifying distinguishes one kind of traffic from another. For more information, see the “Classification” section on page 29-4.
- Policing determines whether a packet is in or out of profile according to the configured policer, and the policer limits the bandwidth consumed by a flow of traffic. The result of this determination is passed to the marker. For more information, see the “Policing and Marking” section on page 29-6.
• Marking evaluates the policer and configuration information for the action to be taken when a packet is out of profile and decides what to do with the packet (pass through a packet without modification, mark down the DSCP value in the packet, or drop the packet). For more information, see the “Policing and Marking” section on page 29-6.

Actions at the egress interface include queueing and scheduling:

• Queueing evaluates the CoS value and determines which of the four egress queues in which to place the packet.

• Scheduling services the four egress queues based on their configured weighted round robin (WRR) weights.

**Figure 29-2  Basic QoS Model**

**Classification**

This feature is available only if your switch is running the EI.

Classification is the process of distinguishing one kind of traffic from another by examining the fields in the packet.

Classification occurs only on a physical interface basis. No support exists for classifying packets at the VLAN level.

You specify which fields in the frame or packet that you want to use to classify incoming traffic.

For non-IP traffic, you have these classification options:

• Use the port default. If the frame does not contain a CoS value, the switch assigns the default port CoS value to the incoming frame.

• Trust the CoS value in the incoming frame (configure the port to trust CoS). Layer 2 IEEE 802.1Q frame headers carry the CoS value in the three most-significant bits of the Tag Control Information field. CoS values range from 0 for low priority to 7 for high priority.
The trust DSCP configuration is meaningless for non-IP traffic. If you configure a port with this option and non-IP traffic is received, the switch assigns the default port CoS value and classifies traffic based on the CoS value.

For IP traffic, you have these classification options:

- Trust the IP DSCP in the incoming packet (configure the port to trust DSCP). The switch assigns the same DSCP to the packet for internal use. The IETF defines the 6 most-significant bits of the 1-byte ToS field as the DSCP. The priority represented by a particular DSCP value is configurable. The supported DSCP values are 0, 8, 10, 16, 18, 24, 26, 32, 34, 40, 46, 48, and 56.
- Trust the CoS value (if present) in the incoming packet. The switch generates the DSCP by using the CoS-to-DSCP map.

An interface can be configured to trust either CoS or DSCP, but not both at the same time.

Classification Based on QoS ACLs

You can use IP standard, IP extended, and Layer 2 MAC access control lists (ACLs) to define a group of packets with the same characteristics (class). In the QoS context, the permit and deny actions in the access control entries (ACEs) have different meanings than with security ACLs:

- If a match with a permit action is encountered (first-match principle), the specified QoS-related action is taken.
- If no match with a permit action is encountered and all the ACEs have been examined, no QoS processing occurs on the packet.
- If multiple ACLs are configured on an interface, the packet matches the first ACL with a permit action, and QoS processing begins.
- Configuration of a deny action is not supported in QoS ACLs on the switch.
- System-defined masks are allowed in class maps with these restrictions:
  - A combination of system-defined and user-defined masks cannot be used in the multiple class maps that are a part of a policy map.
  - System-defined masks that are a part of a policy map must all use the same type of system mask. For example, a policy map cannot have a class map that uses the `permit tcp any any` ACE and another that uses the `permit ip any any` ACE.
  - A policy map can contain multiple class maps that all use the same user-defined mask or the same system-defined mask.

For more information about system-defined masks, see the “Understanding Access Control Parameters” section on page 28-4.

For more information about ACL restrictions, see the “Configuring ACLs” section on page 28-6.

After a traffic class has been defined with the ACL, you can attach a policy to it. A policy might contain multiple classes with actions specified for each one of them. A policy might include commands to classify the class as a particular aggregate (for example, assign a DSCP) or rate-limit the class. This policy is then attached to a particular port on which it becomes effective.

You implement IP ACLs to classify IP traffic by using the `access-list` global configuration command; you implement Layer 2 MAC ACLs to classify Layer 2 traffic by using the `mac access-list extended` global configuration command.
Classification Based on Class Maps and Policy Maps

A class map is a mechanism that you use to isolate and name a specific traffic flow (or class) from all other traffic. The class map defines the criteria used to match against a specific traffic flow to further classify it; the criteria can include matching the access group defined by the ACL. If you have more than one type of traffic that you want to classify, you can create another class map and use a different name. After a packet is matched against the class-map criteria, you further classify it through the use of a policy map.

A policy map specifies which traffic class to act on. Actions can include setting a specific DSCP value in the traffic class or specifying the traffic bandwidth limitations and the action to take when the traffic is out of profile. Before a policy map can be effective, you must attach it to an interface.

You create a class map by using the `class-map` global configuration command or the `class` policy-map configuration command. You should use the `class-map` global configuration command when the map is shared among many ports. When you enter the `class-map` global configuration command, the switch enters the class-map configuration mode. In this mode, you define the match criterion for the traffic by using the `match` class-map configuration command.

You create and name a policy map by using the `policy-map` global configuration command. When you enter this command, the switch enters the policy-map configuration mode. In this mode, you specify the actions to take on a specific traffic class by using the `class` policy-map configuration or `set` policy-map class configuration command. To make the policy map effective, you attach it to an interface by using the `service-policy` interface configuration command.

The policy map can also contain commands that define the policer, the bandwidth limitations of the traffic, and the action to take if the limits are exceeded. For more information, see the “Policing and Marking” section on page 29-6.

A policy map also has these characteristics:

- A policy map can contain multiple class statements.
- A separate policy-map class can exist for each type of traffic received through an interface.
- A policy-map configuration state supersedes any actions due to an interface trust state.

For configuration information, see the “Configuring a QoS Policy” section on page 29-24.

Policing and Marking

Note: This feature is available only if your switch is running the EI.

Policing involves creating a policer that specifies the bandwidth limits for the traffic. Packets that exceed the limits are out of profile or nonconforming. Each policer specifies the action to take for packets that are in or out of profile. These actions, carried out by the marker, include dropping the packet or marking down the packet with a new user-defined value.

You can create an individual policer. QoS applies the bandwidth limits specified in the policer separately to each matched traffic class. You configure this type of policer within a policy map by using the `policy-map` configuration command.

When configuring policing and policers, keep these items in mind:

- By default, no policers are configured.
- Policers can only be configured on a physical port. There is no support for policing at a VLAN level.
Only one policer can be applied to a packet in the input direction.

Only the average rate and committed burst parameters are configurable.

Policing occurs on the ingress interfaces:
- 60 policers are supported on ingress Gigabit-capable Ethernet ports.
- 6 policers are supported on ingress 10/100 Ethernet ports.
- Granularity for the average burst rate is 8 Mbps for Gigabit Ethernet ports.

On an interface configured for QoS, all traffic received through the interface is classified, policed, and marked according to the policy map attached to the interface. On a trunk interface configured for QoS, traffic in all VLANs received through the interface is classified, policed, and marked according to the policy map attached to the interface.

**Note**

You cannot configure policers on the egress interfaces.

### Mapping Tables

This feature is available only if your switch is running the EI.

During classification, QoS uses a configurable CoS-to-DSCP map to derive an internal DSCP value from the received CoS value. This DSCP value represents the priority of the traffic.

Before the traffic reaches the scheduling stage, QoS uses the configurable DSCP-to-CoS map to derive a CoS value from the internal DSCP value. The CoS value is used to select one of the four egress queues.

The CoS-to-DSCP and DSCP-to-CoS maps have default values that might or might not be appropriate for your network.

For configuration information, see the “Configuring CoS Maps” section on page 29-32.

### Queueing and Scheduling

Both the SI and EI support this feature.

The switch gives QoS-based IEEE 802.1p CoS values. QoS uses classification and scheduling to send network traffic from the switch in a predictable manner. QoS classifies frames by assigning priority-indexed CoS values to them and gives preference to higher-priority traffic such as telephone calls.

### How Class of Service Works

Before you set up IEEE 802.1p CoS on a that operates with the Catalyst 6000 family of switches, see the Catalyst 6000 documentation. There are differences in the IEEE 802.1p implementation that you should understand to ensure compatibility.
Port Priority

Frames received from users in the administratively defined VLANs are classified or tagged for transmission to other devices. Based on rules that you define, a unique identifier (the tag) is inserted in each frame header before it is forwarded. The tag is examined and understood by each device before any broadcasts or transmissions to other switches, routers, or end stations. When the frame reaches the last switch or router, the tag is removed before the frame is sent to the target end station. VLANs that are assigned on trunk or access ports without identification or a tag are called native or untagged frames.

For IEEE 802.1Q frames with tag information, the priority value from the header frame is used. For native frames, the default priority of the input port is used.

Port Scheduling

Each port on the switch has a single receive queue buffer (the ingress port) for incoming traffic. When an untagged frame arrives, it is assigned the value of the port as its port default priority. You assign this value by using the CLI or . A tagged frame continues to use its assigned CoS value when it passes through the ingress port.

CoS configures each transmit port (the egress port) with a normal-priority transmit queue and a high-priority transmit queue, depending on the frame tag or the port information. Frames in the normal-priority queue are forwarded only after frames in the high-priority queue are forwarded.

The switch (IEEE 802.1P user priority) has four priority queues. The frames are forwarded to appropriate queues based on the priority-to-queue mapping that you defined.

Egress CoS Queues

The switch supports four CoS queues for each egress port. For each queue, you can specify these types of scheduling:

- Strict priority scheduling
  Strict priority scheduling is based on the priority of queues. Packets in the high-priority queue are always sent first, and packets in the low-priority queue are not sent until all the high-priority queues become empty.
  The default scheduling method is strict priority.

- Weighted round-robin (WRR) scheduling
  WRR scheduling requires you to specify a number that indicates the importance (weight) of the queue relative to the other CoS queues. WRR scheduling prevents the low-priority queues from being completely neglected during periods of high-priority traffic. The WRR scheduler sends some packets from each queue in turn. The number of packets it sends corresponds to the relative importance of the queue. For example, if one queue has a weight of 3 and another has a weight of 4, three packets are sent from the first queue for every four that are sent from the second queue. By using this scheduling, low-priority queues have the opportunity to send packets even though the high-priority queues are not empty.

- Strict priority and WRR scheduling
  Strict priority and WRR scheduling, also referred to as strict priority queueing, uses one of the egress queues as an expedite queue (queue 4). The remaining queues participate in WRR. When the expedite queue is configured, it is a priority queue and is serviced until it is empty before the other queues are serviced by WRR scheduling.
You can enable the egress expedite queue and assign WRR weights to the other queues by using the `wrr-queue bandwidth weight1 weight2 weight3 0` global configuration command.

## Configuring Auto-QoS

**Note**

This feature is available only if your switch is running the EI.

You can use the auto-QoS feature to simplify the deployment of existing QoS features. Auto-QoS makes assumptions about the network design, and as a result, the switch can prioritize different traffic flows and appropriately use the egress queues instead of using the default QoS behavior (the switch offers best-effort service to each packet regardless of the packet contents or size and sends it from a single queue).

When you enable auto-QoS, it automatically classifies traffic based on the traffic type and ingress packet label. The switch uses the resulting classification to choose the appropriate egress queue.

You use auto-QoS commands to identify ports connected to Cisco IP Phones and to devices running the Cisco SoftPhone application. You also use the commands to identify ports that receive trusted traffic through an uplink. Auto-QoS then performs these functions:

- Detects the presence or absence of IP phones
- Configures QoS classification
- Configures egress queues

These sections describe how to configure auto-QoS on your switch:

- Generated Auto-QoS Configuration, page 29-9
- Effects of Auto-QoS on the Configuration, page 29-11
- Configuration Guidelines, page 29-12
- Upgrading from a Previous Software Release, page 29-12
- Enabling Auto-QoS for VoIP, page 29-13

### Generated Auto-QoS Configuration

When auto-QoS is enabled, it uses the ingress packet label to classify traffic and to configure the egress queues as described in Table 29-2.

<table>
<thead>
<tr>
<th>Traffic Types, Packet Labels, and Egress Queues</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DSCP</strong></td>
</tr>
<tr>
<td>DSCP</td>
</tr>
<tr>
<td>CoS</td>
</tr>
<tr>
<td>CoS-to-Queue Map</td>
</tr>
<tr>
<td>Egress Queue</td>
</tr>
</tbody>
</table>
When you enable the auto-QoS feature on the first interface, these automatic actions occur:

- When you enter the `auto qos voip cisco-phone` interface configuration command on a port at the edge of a network that is connected to a Cisco IP Phone, the switch enables the trusted boundary feature. The switch uses the Cisco Discovery Protocol (CDP) to detect the presence or absence of a Cisco IP Phone. When a Cisco IP Phone is detected, the ingress classification on the interface is set to trust the QoS label received in the packet. When a Cisco IP Phone is absent, the ingress classification is set to not trust the QoS label in the packet. The switch configures egress queues on the port according to the settings in Table 29-3.

- When you enter the `auto qos voip cisco-softphone` interface configuration command on a port at the edge of the network that is connected to a device running the Cisco SoftPhone, the switch uses policing to determine whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. The switch configures egress queues on the port according to the settings in Table 29-3.

- When you enter the `auto qos voip trust` interface configuration command on a port connected to the interior of the network, the switch trusts the CoS value in ingress packets (the assumption is that traffic has already been classified by other edge devices). The switch configures egress queues on the port according to the settings in Table 29-3.

For information about the trusted boundary feature, see the “Configuring Trusted Boundary” section on page 29-21.

When you enable auto-QoS by using the `auto qos voip cisco-phone`, `auto qos voip cisco-softphone`, or the `auto qos voip trust` interface configuration command, the switch automatically generates a QoS configuration based on the traffic type and ingress packet label and applies the commands listed in Table 29-4 to the interface.

<td>The switch automatically enables standard QoS and configures the CoS-to-DSCP map (maps CoS values in incoming packets to a DSCP value) as shown in Table 29-2 on page 29-9.</td>
<td>Switch(config)# mls qos map cos-dscp 0 8 16 26 32 46 48 56</td>
</tr>
<tr>
<td>If you entered the <code>auto qos voip trust</code> command, the switch automatically sets the ingress classification on the interface to trust the CoS value in the packet.</td>
<td>Switch(config-if)# mls qos trust cos</td>
</tr>
</tbody>
</table>
Chapter 29      Configuring QoS

Table 29-4   Generated Auto-QoS Configuration (continued)

<table>
<thead>
<tr>
<th>Description</th>
<th>Automatically Generated QoS Command Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you entered the <strong>auto qos voip cisco-phone</strong> command, the switch automatically enables the trusted boundary feature, which uses the CDP to detect the presence or the absence of a Cisco IP Phone.</td>
<td>Switch(config-if)# mls qos trust device cisco-phone</td>
</tr>
<tr>
<td>If you entered the <strong>auto qos voip cisco-softphone</strong> command, the switch automatically creates class maps and policy maps.</td>
<td>Switch(config)# class-map match-all AutoQoS-VoIP-RTP-Trust Switch(config-cmap)# match ip dscp 46 Switch(config)# class-map match-all AutoQoS-VoIP-Control-Trust Switch(config-cmap)# match ip dscp 24 26 Switch(config)# policy-map AutoQoS-Police-SoftPhone Switch(config-pmap)# class AutoQoS-VoIP-RTP-Trust Switch(config-pmap-c)# set ip dscp 46 Switch(config-pmap-c)# police 1000000 4096 exceed-action drop Switch(config-pmap)# class AutoQoS-VoIP-Control-Trust Switch(config-pmap-c)# set ip dscp 24 Switch(config-pmap-c)# police 1000000 4096 exceed-action drop</td>
</tr>
<tr>
<td>After creating the class maps and policy maps, the switch automatically applies the policy map called <strong>AutoQoS-Policy-SoftPhone</strong> to an ingress interface on which auto-QoS with the Cisco SoftPhone feature is enabled.</td>
<td>Switch(config-if)# service-policy input AutoQoS-Policy-SoftPhone</td>
</tr>
</tbody>
</table>
| The switch automatically assigns the egress queue usage (as shown in Table 29-3 on page 29-10) on this interface. If some of your network traffic requires expedited forwarding, configure queue 4 as the expedite queue. When the WRR weight of a queue is set to 0, this queue becomes an expedite queue. Only queue 4 can be the expedite queue. The switch configures the CoS-to-egress-queue map:  
  • CoS values 0 and 1 select queue 1.  
  • CoS values 2 and 4 select queue 2.  
  • CoS values 3, 6, and 7 select queue 3.  
  • CoS value 5 selects queue 4. | Switch(config)# wrr-queue bandwidth 10 20 70 1 Switch(config)# wrr-queue cos-map Switch(config)# wrr-queue cos-map 1 0 1 Switch(config)# wrr-queue cos-map 2 2 4 Switch(config)# wrr-queue cos-map 3 3 6 7 Switch(config)# wrr-queue cos-map 4 5 |

**Effects of Auto-QoS on the Configuration**

When auto-QoS is enabled, the **auto qos voip** interface configuration command and the generated configuration are added to the running configuration.

The switch applies the auto-QoS-generated commands as if the commands were entered from the CLI. An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.
Configuration Guidelines

Before configuring auto-QoS, you should be aware of this information:

- In releases earlier than Cisco IOS Release 12.1(20)EA2, auto-QoS configures the switch for VoIP only with Cisco IP Phones.
- In Cisco IOS Release 12.1(20)EA2 or later, auto-QoS configures the switch for VoIP with Cisco IP Phones and with devices running the Cisco SoftPhone application.

Note When a device running Cisco SoftPhone is connected to a port, the switch supports only one Cisco SoftPhone application per port.

- To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. If necessary, you can fine-tune the QoS configuration, but we recommend that you do so only after the auto-QoS configuration is completed. For more information, see the “Effects of Auto-QoS on the Configuration” section on page 29-11.
- After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes AutoQoS in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map to it.
- You can enable auto-QoS on static, dynamic-access, voice VLAN access, and trunk ports.
- By default, the CDP is enabled on all interfaces. For auto-QoS to function properly, do not disable the CDP.
- When auto-QoS is enabled for VoIP with the Cisco SoftPhone, the switch uses one mask for the auto-QoS configuration.
- This release supports only Cisco IP SoftPhone Version 1.3(3) or later.
- Connected devices must use Cisco Call Manager Version 4 or later.

Upgrading from a Previous Software Release

In Cisco IOS Release 12.2(20)EA2, the implementation for auto-QoS changed from the previous release. The generated auto-QoS configuration was changed and support for the Cisco SoftPhone feature was added.

If auto-QoS is configured on the switch, if your switch is running a release earlier than Cisco IOS Release 12.2(20)EA2, and if you upgrade to Cisco IOS Release 12.2(20)EA2 or later, the configuration file will not contain the new configuration, and auto-QoS will not operate. Follow these steps to update the auto-QoS settings in your configuration file:

1. Upgrade your switch to Cisco IOS Release 12.2(20)EA2 or later.
2. Disable auto-QoS on all ports on which auto-QoS was enabled.
3. Return all the global auto-QoS settings to their default values by using the no commands.
4. Re-enable auto-QoS on the ports on which auto-QoS was disabled in Step 2. Configure the ports with the same auto-QoS settings as the previous ones.
Enabling Auto-QoS for VoIP

Beginning in privileged EXEC mode, follow these steps to enable auto-QoS for VoIP within a QoS domain:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
<td>Specify the interface that is connected to a Cisco IP Phone, and enter</td>
</tr>
<tr>
<td></td>
<td></td>
<td>interface configuration mode. You also can specify the uplink interface</td>
</tr>
<tr>
<td></td>
<td></td>
<td>that is connected to another trusted switch or router in the interior of</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the network.</td>
</tr>
<tr>
<td>3</td>
<td>auto qos voip {cisco-phone</td>
<td>Enable auto-QoS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>or trust}</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The keywords have these meanings:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• cisco-phone—If the interface is connected to a Cisco IP Phone, the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>QoS labels of incoming packets are trusted only when the IP phone is</td>
</tr>
<tr>
<td></td>
<td></td>
<td>detected.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• trust—The uplink interface is connected to a trusted switch or router,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>and the VoIP classification in the ingress packet is trusted.</td>
</tr>
<tr>
<td>4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>5</td>
<td>show auto qos interface</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td></td>
<td>interface interface-id</td>
<td>This command displays the auto-QoS command on the interface on which</td>
</tr>
<tr>
<td></td>
<td></td>
<td>auto-QoS was enabled. You can use the show running-config privileged</td>
</tr>
<tr>
<td></td>
<td></td>
<td>EXEC command to display the auto-QoS configuration and the user</td>
</tr>
<tr>
<td></td>
<td></td>
<td>modifications.</td>
</tr>
</tbody>
</table>

To disable auto-QoS on the switch and return to the default port trust state set (untrusted), follow these steps:

1. Use the no auto qos voip interface configuration command on all interfaces on which auto-QoS is enabled. To disable auto-QoS on multiple interfaces at the same time, you can use the interface range global configuration command.

2. After disabling auto-QoS on all interfaces on which auto-QoS was enabled, return the egress queues and CoS-to-DSCP map to the default settings by using these global configuration commands:
   - no wrq-queue bandwidth
   - no wrq-queue cos-map
   - no mls qos map cos-dscp

To display the QoS commands that are automatically generated when auto-QoS is enabled or disabled, enter the debug auto qos privileged EXEC command before enabling auto-QoS. For more information, see the “Using the debug auto qos Command” section on page 31-20.

This example shows how to enable auto-QoS and to trust the QoS labels in incoming packets when the device connected to the interface is detected as a Cisco IP Phone:

```
Switch(config)# interface
Switch(config-if)# auto qos voip cisco-phone
```

This example shows how to enable auto-QoS and to trust the QoS labels in incoming packets when the switch or router connected to the interface is a trusted device:
Displaying Auto-QoS Information

To display the initial auto-QoS configuration, use the `show auto qos [interface [interface-id]]` privileged EXEC command. To display any user changes to that configuration, use the `show running-config` privileged EXEC command. You can compare the `show auto qos` and the `show running-config` command output to identify the user-defined QoS settings.

To display information about the QoS configuration that might be affected by auto-QoS, use one of these commands:

- `show mls qos`
- `show mls qos map cos-dscp`
- `show wrr-queue bandwidth`
- `show wrr-queue cos-map`

For more information about these commands, see the command reference for this release.

Auto-QoS Configuration Example

Note

This example is applicable only if your switch is running the EI.

This section describes how you could implement auto-QoS in a network, as shown in Figure 29-3. For optimum QoS performance, auto-QoS should be enabled on all the devices in the network.
The intelligent wiring closets in Figure 29-3 are composed of Catalyst 2950 switches running the EI and Catalyst 3550 switches. The object of this example is to prioritize the VoIP traffic over all other traffic. To do so, enable auto-QoS on the switches at the edge of the QoS domains in the wiring closets.

You should not configure any standard-QoS commands before entering the auto-QoS commands. You can fine-tune the QoS configuration, but we recommend that you do so only after the auto-QoS configuration is completed.
Beginning in privileged EXEC mode, follow these steps to configure the switch at the edge of the QoS domain to prioritize the VoIP traffic over all other traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>debug auto qos</strong></td>
</tr>
<tr>
<td></td>
<td>Enable debugging for auto-QoS. When debugging is enabled, the switch displays the QoS configuration that is automatically generated when auto-QoS is enabled.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>cdp enable</strong></td>
</tr>
<tr>
<td></td>
<td>Enable CDP globally. By default, it is enabled.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>interface interface-id</strong></td>
</tr>
<tr>
<td></td>
<td>Specify the switch port connected to the Cisco IP Phone, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>auto qos voip cisco-phone</strong></td>
</tr>
<tr>
<td></td>
<td>Enable auto-QoS on the interface, and specify that the interface is connected to a Cisco IP Phone.</td>
</tr>
<tr>
<td></td>
<td>The QoS labels of incoming packets are trusted only when the IP phone is detected.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td></td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>interface interface-id</strong></td>
</tr>
<tr>
<td></td>
<td>Repeat Steps 4 to 6 for as many ports as are connected to the Cisco IP Phone.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>auto qos voip trust</strong></td>
</tr>
<tr>
<td></td>
<td>Specify the switch port identified as connected to a trusted switch or router, and enter interface configuration mode. See Figure 29-3.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td><strong>show auto qos</strong></td>
</tr>
<tr>
<td></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td></td>
<td>This command displays the auto-QoS command on the interface on which auto-QoS was enabled. You can use the <code>show running-config</code> privileged EXEC command to display the auto-QoS configuration and the user modifications.</td>
</tr>
<tr>
<td></td>
<td>For information about the QoS configuration that might be affected by auto-QoS, see the “Displaying Auto-QoS Information” section on page 26-12.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td><strong>copy running-config startup-config</strong></td>
</tr>
<tr>
<td></td>
<td>Save the <code>auto qos voip</code> interface configuration commands and the generated auto-QoS configuration in the configuration file.</td>
</tr>
</tbody>
</table>

## Configuring Standard QoS

Before configuring standard QoS, you must have a thorough understanding of these items:

- The types of applications used and the traffic patterns on your network.
- Traffic characteristics and needs of your network. Is the traffic bursty? Do you need to reserve bandwidth for voice and video streams?
- Bandwidth requirements and speed of the network.
- Location of congestion points in the network.

This section describes how to configure standard QoS on your switch:
If your switch is running the SI, you can configure only the features described in the “Configuring Classification Using Port Trust States” and the “Configuring the Egress Queues” sections. You can also display the QoS information as described in the “Displaying Standard QoS Information” section.

- Default Standard QoS Configuration, page 29-17
- Configuration Guidelines, page 29-17
- Configuring Classification Using Port Trust States, page 29-19
- Configuring a QoS Policy, page 29-24
- Configuring CoS Maps, page 29-32
- Configuring the Egress Queues, page 29-35

**Default Standard QoS Configuration**

This is the default standard QoS configuration:

**Note**

You can configure policy maps, policers, the CoS-to-DSCP map, and the DSCP-to-CoS map only if your switch is running the EI.

- The default port CoS value is 0.
- The CoS value of 0 is assigned to all incoming packets.
- The default port trust state is untrusted.
- No policy maps are configured.
- No policers are configured.
- The default CoS-to-DSCP map is shown in Table 29-7.
- The default DSCP-to-CoS map is shown in Table 29-8.
- The default scheduling method for the egress queues is strict priority.
- For default CoS and WRR values, see the “Configuring the Egress Queues” section on page 29-35.

**Note**

In software releases earlier than Cisco IOS Release 12.1(11)EA1, the switch uses the CoS value of incoming packets without modifying the DSCP value. You can configure this by enabling pass-through mode on the port. For more information, see the “Enabling Pass-Through Mode” section on page 29-23.

**Configuration Guidelines**

**Note**

These guidelines are applicable only if your switch is running the EI.

Before beginning the QoS configuration, you should be aware of this information:
You must disable the IEEE 802.3x flowcontrol on all ports before enabling QoS on the switch. To disable it, use the `flowcontrol receive off` and `flowcontrol send off` interface configuration commands.

If you have EtherChannel ports configured on your switch, you must configure QoS classification, policing, mapping, and queuing on the individual physical ports that comprise the EtherChannel. You must decide whether the QoS configuration should match on all ports in the EtherChannel.

It is not possible to match IP fragments against configured IP extended ACLs to enforce QoS. IP fragments are sent as best-effort traffic. IP fragments are denoted by fields in the IP header.

All ingress QoS processing actions apply to control traffic (such as spanning-tree bridge protocol data units [BPDUs] and routing update packets) that the switch receives.

Only an ACL that is created for physical interfaces can be attached to a class map.

Only one ACL per class map and only one `match` command per class map are supported. The ACL can have multiple access control entries, which are commands that match fields against the contents of the packet.

Policy maps with ACL classification in the egress direction are not supported and cannot be attached to an interface by using the `service-policy input policy-map-name` interface configuration command.

In a policy map, the class named `class-default` is not supported. The switch does not filter traffic based on the policy map defined by the `class class-default` policy-map configuration command.

For more information about guidelines for configuring ACLs, see the “Classification Based on QoS ACLs” section on page 29-5.

For information about applying ACLs to physical interfaces, see the “Guidelines for Applying ACLs to Physical Interfaces” section on page 28-5.

If a policy map with a system-defined mask and a security ACL with a user-defined mask are configured on an interface, the switch might ignore the actions specified by the policy map and perform only the actions specified by the ACL. For information about masks, see the “Understanding Access Control Parameters” section on page 28-4.

If a policy map with a user-defined mask and a security ACL with a user-defined mask are configured on an interface, the switch takes one of the actions as described in Table 29-5. For information about masks, see the “Understanding Access Control Parameters” section on page 28-4.

### Table 29-5 Interaction Between Policy Maps and Security ACLs

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Configuring Classification Using Port Trust States

This section describes how to classify incoming traffic by using port trust states:

- Configuring the Trust State on Ports within the QoS Domain, page 29-19
- Configuring the CoS Value for an Interface, page 29-20
- Configuring Trusted Boundary, page 29-21
- Enabling Pass-Through Mode, page 29-23

Note

Both the SI and EI support this feature.

Configuring the Trust State on Ports within the QoS Domain

Packets entering a QoS domain are classified at the edge of the QoS domain. When the packets are classified at the edge, the switch port within the QoS domain can be configured to one of the trusted states because there is no need to classify the packets at every switch within the QoS domain. Figure 29-4 shows a sample network topology.

Figure 29-4 Port Trusted States within the QoS Domain

Beginning in privileged EXEC mode, follow these steps to configure the port to trust the classification of the traffic that it receives:
To return a port to its untrusted state, use the `no mls qos trust` interface configuration command.

For information on how to change the default CoS value, see the “Configuring the CoS Value for an Interface” section on page 29-20. For information on how to configure the CoS-to-DSCP map, see the “Configuring the CoS-to-DSCP Map” section on page 29-32.

### Configuring the CoS Value for an Interface

QoS assigns the CoS value specified with the `mls qos cos` interface configuration command to untagged frames received on trusted and untrusted ports.

Beginning in privileged EXEC mode, follow these steps to define the default CoS value of a port or to assign the default CoS to all incoming packets on the port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface to be trusted, and enter interface configuration mode. Valid interfaces include physical interfaces.</td>
</tr>
<tr>
<td>Step 3 mls qos trust [cos</td>
<td>dscp]</td>
</tr>
<tr>
<td></td>
<td>cos—Classifies ingress packets with the packet CoS values. For tagged IP packets, the DSCP value of the packet is modified based on the CoS-to-DSCP map. The egress queue assigned to the packet is based on the packet CoS value.</td>
</tr>
<tr>
<td></td>
<td>dscp—Classifies ingress packets with packet DSCP values. For non-IP packets, the packet CoS value is set to 0 for tagged packets; the default port CoS is used for untagged packets. Internally, the switch modifies the CoS value by using the DSCP-to-CoS map.</td>
</tr>
<tr>
<td>Note</td>
<td>In software releases earlier than Cisco IOS Release 12.1(11)EA1, the <code>mls qos trust</code> command is available only when the switch is running the EI. Use the <code>cos</code> keyword if your network is composed of Ethernet LANs. Use the <code>dscp</code> keyword if your network is not composed of only Ethernet LANs and if you are familiar with sophisticated QoS features and implementations. For more information about this command, see the command reference for this release.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show mls qos interface</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>[interface-id] [policers]</td>
<td></td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To return to the default setting, use the `no mls qos cos {default-cos | override}` interface configuration command.

## Configuring Trusted Boundary

In a typical network, you connect a Cisco IP Phone to a switch port as shown in Figure 29-4 on page 29-19, and cascade devices that generate data packets from the back of the telephone. The Cisco IP Phone guarantees the voice quality through a shared data link by marking the CoS level of the voice packets as high priority (CoS = 5) and by marking the data packets as low priority (CoS = 0). Traffic sent from the telephone to the switch is typically marked with a tag that uses the IEEE 802.1Q header. The header contains the VLAN information and the class of service (CoS) 3-bit field, which is the priority of the packet.

For most Cisco IP Phone configurations, the traffic sent from the telephone to the switch should be trusted to ensure that voice traffic is properly prioritized over other types of traffic in the network. By using the `mls qos trust cos` interface configuration command, you configure the switch port to which the telephone is connected to trust the CoS labels of all traffic received on that port.

With the trusted setting, you also can use the trusted boundary feature to prevent misuse of a high-priority queue if a user bypasses the telephone and connects the PC directly to the switch. Without trusted boundary, the CoS labels generated by the PC are trusted by the switch (because of the trusted CoS setting). By contrast, trusted boundary uses CDP to detect the presence of a Cisco IP Phone (such as the Cisco IP Phone 7910, 7935, 7940, and 7960) on a switch port. If the telephone is not detected, the
trusted boundary feature disables the trusted setting on the switch port and prevents misuse of a high-priority queue. Note that the trusted boundary feature is not effective if the PC and Cisco IP Phone are connected to a hub that is connected to the switch.

In some situations, you can prevent a PC connected to the Cisco IP Phone from taking advantage of a high-priority data queue. You can use the `switchport priority extend cos` interface configuration command to configure the telephone through the switch CLI to override the priority of the traffic received from the PC.

Beginning in privileged EXEC mode, follow these steps to configure trusted boundary on a switch port:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td><code>cdp enable</code></td>
<td>Enable CDP globally. By default, it is enabled.</td>
</tr>
<tr>
<td>3</td>
<td><code>interface interface-id</code></td>
<td>Specify the interface to be trusted, and enter interface configuration mode. Valid interfaces include physical interfaces.</td>
</tr>
<tr>
<td>4</td>
<td><code>cdp enable</code></td>
<td>Enable CDP on the interface. By default, CDP is enabled.</td>
</tr>
<tr>
<td>5</td>
<td><code>mls qos trust device cisco-phone</code></td>
<td>Configure the Cisco IP Phone as a trusted device on the interface. You cannot enable both trusted boundary and auto-QoS (auto qos voip interface configuration command) at the same time; they are mutually exclusive.</td>
</tr>
<tr>
<td>6</td>
<td><code>mls qos trust cos</code></td>
<td>Configure the port trust state to trust the CoS value of the ingress packet. By default, the port is not trusted. Note In software releases earlier than Cisco IOS Release 12.1(11)EA1, the <code>mls qos trust cos</code> command is available only when the switch is running the EI. For more information on this command, see the command reference for this release.</td>
</tr>
<tr>
<td>7</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>8</td>
<td><code>show mls qos interface [interface-id]</code> [policers]</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>9</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

When you enter the `no mls qos trust` interface configuration command, trusted boundary is not disabled. If this command is entered and the port is connected to a Cisco IP Phone, the port does not trust the classification of traffic that it receives. To disable trusted boundary, use the `no mls qos trust device` interface configuration command.

If you enter the `mls qos cos override` interface configuration command, the port does not trust the classification of the traffic that it receives, even when it is connected to a Cisco IP Phone.

You cannot enable trusted boundary if auto-QoS is already enabled and vice-versa. If auto-QoS is enabled and a Cisco IP Phone is absent on a port, the port does not trust the classification of traffic that it receives.

Table 29-6 lists the port configuration when an IP phone is present or absent.
Enabling Pass-Through Mode

In software releases earlier than Cisco IOS Release 12.1(11)EA1, the switch is in pass-through mode. It uses the CoS value of incoming packets without modifying the DSCP value and sends the packets from one of the four egress queues. You cannot enable or disable pass-through mode if your switch is running a software release earlier than Cisco IOS Release 12.1(11)EA1.

In Cisco IOS Release 12.1(11)EA1 or later, the switch assigns a CoS value of 0 to all incoming packets without modifying the packets. The switch offers best-effort service to each packet regardless of the packet contents or size and sends it from a single egress queue.

Beginning in privileged EXEC mode, follow these steps to enable pass-through mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>mls qos trust cos pass-through dscp</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show mls qos interface [interface-id]</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable pass-through mode, use the **no mls qos trust pass-through dscp** interface configuration command.

If you enter the **mls qos cos override** and the **mls qos trust [cos | dscp]** interface commands when pass-through mode is enabled, pass-through mode is disabled.

If you enter the **mls qos trust cos pass-through dscp** interface configuration command when the **mls qos cos override** and the **mls qos trust [cos | dscp]** interface commands are already configured, pass-through mode is disabled.
Configuring a QoS Policy

This feature is available only if your switch is running the EI.

Configuring a QoS policy typically requires classifying traffic into classes, configuring policies applied to those traffic classes, and attaching policies to interfaces.

For background information, see the “Classification” section on page 29-4 and the “Policing and Marking” section on page 29-6.

This section contains this configuration information:

- Classifying Traffic by Using ACLs, page 29-24
- Classifying Traffic by Using Class Maps, page 29-28
- Classifying, Policing, and Marking Traffic by Using Policy Maps, page 29-29

Classifying Traffic by Using ACLs

You can classify IP traffic by using IP standard or IP extended ACLs; you can classify Layer 2 traffic by using Layer 2 MAC ACLs.

Beginning in privileged EXEC mode, follow these steps to create an IP standard ACL for IP traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>access-list access-list-number { permit</td>
</tr>
</tbody>
</table>

Note

Deny statements are not supported for QoS ACLs. See the “Classification Based on QoS ACLs” section on page 29-5 for more details.

The source is the source address of the network or host from which the packet is being sent, specified in one of three ways:
- The 32-bit quantity in dotted decimal format.
- The keyword any as an abbreviation for source and source-wildcard of 0.0.0.0 255.255.255.255. You do not need to enter a source wildcard.
- The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0. (Optional) The source-wildcard variable applies wildcard bits to the source (see first bullet item).
Configuring Standard QoS

To delete an ACL, use the `no access-list access-list-number` global configuration command.

This example shows how to allow access for only those hosts on the two specified networks. The wildcard bits apply to the host portions of the network addresses. Any host with a source address that does not match the ACL statements is rejected.

```
Switch(config)# access-list 1 permit 192.5.255.0 0.0.0.255
Switch(config)# access-list 1 permit 36.0.0.0 0.0.0.255
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show access-lists</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

For more information about creating IP standard ACLs, see the “Guidelines for Applying ACLs to Physical Interfaces” section on page 28-5.
Beginning in privileged EXEC mode, follow these steps to create an IP extended ACL for IP traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
</tbody>
</table>
| **Step 2** | **access-list access-list-number**
| | {permit | remark} protocol
| | {source source-wildcard | host source | any} [operator port] [destination destination-wildcard | host destination | any} [operator port] [dscp dscp-value] [time-range time-range-name] | Create an IP extended ACL, repeating the command as many times as necessary.
| | For access-list-number, enter the ACL number. The range is 100 to 199 and 2000 to 2699. |
| | Enter **permit** to permit access if conditions are matched. |
| | Enter **remark** to specify an ACL entry comment up to 100 characters. |
| | **Note** Deny statements are not supported for QoS ACLs. See the “Classification Based on QoS ACLs” section on page 29-5 for more details. |
| | For **protocol**, enter the name or number of an IP protocol. Use the question mark (?) to see a list of available protocol keywords. |
| | For **source**, enter the network or host from which the packet is being sent. For **source-wildcard**, enter the wildcard bits by placing ones in the bit positions that you want to ignore. You specify the **source** and **source-wildcard** by using dotted decimal notation, by using the **any** keyword as an abbreviation for source 0.0.0.0 source-wildcard 255.255.255.255, or by using the **host** keyword for source 0.0.0.0. |
| | For **destination**, enter the network or host to which the packet is being sent. You have the same options for specifying the **destination** and **destination-wildcard** as those described for **source** and **source-wildcard**. |
| | Define a destination or source port. |
| | • The **operator** can be only **eq** (equal). |
| | • If **operator** is after **source source-wildcard**, conditions match when the source port matches the defined port. |
| | • If **operator** is after **destination destination-wildcard**, conditions match when the destination port matches the defined port. |
| | • The **port** is a decimal number or name of a TCP or UDP port. The number can be from 0 to 65535. |
| | • Use TCP port names only for TCP traffic. |
| | • Use UDP port names only for UDP traffic. |
| | Enter **dscp** to match packets with any of the 13 supported DSCP values (0, 8, 10, 16, 18, 24, 26, 32, 34, 40, 46, 48, and 56) or use the question mark (?) to see a list of available values. |
| | The **time-range** keyword is optional. For information about this keyword, see the “Applying Time Ranges to ACLs” section on page 28-14. |
| **Step 3** | **end** | Return to privileged EXEC mode. |
Chapter 29  Configuring QoS

### Configuring Standard QoS

For more information about creating IP extended ACLs, see the “Guidelines for Applying ACLs to Physical Interfaces” section on page 28-5.

To delete an ACL, use the `no access-list access-list-number` global configuration command.

This example shows how to create an ACL that permits only TCP traffic from the destination IP address 128.88.1.2 with TCP port number 25:

```
Switch(config)# access-list 102 permit tcp 0.0.0.0 255.255.255.255 128.88.1.2 0.0.0.0 eq 25
```

Beginning in privileged EXEC mode, follow these steps to create a Layer 2 MAC ACL for Layer 2 traffic:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>mac access-list extended name</td>
<td>Create a Layer 2 MAC ACL by specifying the name of the list. After entering this command, the mode changes to extended MAC ACL configuration.</td>
</tr>
<tr>
<td>3</td>
<td>permit [any</td>
<td>host source MAC address]</td>
</tr>
<tr>
<td></td>
<td>any</td>
<td>host destination MAC address] [aarp</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For <code>source MAC address</code>, enter the MAC address of the host from which the packet is being sent. You specify this by using the <code>any</code> keyword to deny any source MAC address or by using the <code>host</code> keyword and the source in the hexadecimal format (H.H.H).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For <code>destination MAC address</code>, enter the MAC address of the host to which the packet is being sent. You specify this by using the <code>any</code> keyword to deny any destination MAC address or by using the <code>host</code> keyword and the destination in the hexadecimal format (H.H.H).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Optional) You can also enter these options:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>aarp</td>
</tr>
<tr>
<td>4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>5</td>
<td>show access-lists [number</td>
<td>name]</td>
</tr>
<tr>
<td>6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

For more information about creating MAC extended ACLs, see the “Creating Named MAC Extended ACLs” section on page 28-17.

To delete an ACL, use the `no mac access-list extended name` global configuration command.
This example shows how to create a Layer 2 MAC ACL with a permit statement. The statement allows traffic from the host with MAC address 0001.0000.0001 to the host with MAC address 0002.0000.0001.

Switch(config)# mac access-list extended maclist1
Switch(config-ext-macl)# permit host 0001.0000.0001 host 0002.0000.0001

Classifying Traffic by Using Class Maps

You use the class-map global configuration command to isolate a specific traffic flow (or class) from all other traffic and to name it. The class map defines the criteria to use to match against a specific traffic flow to further classify it. Match statements can only include ACLs. The match criterion is defined with one match statement entered within the class-map configuration mode.

Note

You can also create class maps during policy map creation by using the class policy-map configuration command. For more information, see the “Classifying, Policing, and Marking Traffic by Using Policy Maps” section on page 29-29.

Beginning in privileged EXEC mode, follow these steps to create a class map and to define the match criterion to classify traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> access-list access-list-number permit {source source-wildcard</td>
<td>Create an IP standard or extended ACL for IP traffic or a Layer 2 MAC ACL for non-IP traffic, repeating the command as many times as necessary. For more information, see the “Guidelines for Applying ACLs to Physical Interfaces” section on page 28-5 and the “Classifying Traffic by Using ACLs” section on page 29-24.</td>
</tr>
<tr>
<td>{host source}</td>
<td>protocol {source source-wildcard</td>
</tr>
<tr>
<td>mac access-list extended name</td>
<td>Deny statements are not supported for QoS ACLs. See the “Classification Based on QoS ACLs” section on page 29-5 for more details.</td>
</tr>
<tr>
<td>permit {any</td>
<td>host source MAC address}</td>
</tr>
<tr>
<td><strong>Step 3</strong> class-map class-map-name</td>
<td>Create a class map, and enter class-map configuration mode. By default, no class maps are defined. For class-map-name, specify the name of the class map.</td>
</tr>
</tbody>
</table>
To delete an existing class map, use the `no class-map class-map-name` global configuration command.

To remove a match criterion, use the `no match {access-group acl-index | access-group name acl-name | ip dscp dscp-list}` class-map configuration command.

This example shows how to configure the class map called `class1`. The `class1` has one match criterion, which is an ACL called `103`.

```
Switch(config)# access-list 103 permit any any tcp eq 80
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# end
Switch#
```

### Classifying, Policing, and Marking Traffic by Using Policy Maps

A policy map specifies which traffic class to act on. Actions can include setting a specific DSCP value in the traffic class and specifying the traffic bandwidth limitations for each matched traffic class (policer) and the action to take when the traffic is out of profile (marking or dropping).

A policy map also has these characteristics:

- A policy map can contain multiple class statements, each with different match criteria and policers.
- A separate policy-map class can exist for each type of traffic received through an interface.

You can attach only one policy map per interface in the input direction.
Beginning in privileged EXEC mode, follow these steps to create a policy map:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>access-list access-list-number permit {source source-wildcard</td>
<td>host source } | \any} | \or \access-list access-list-number {permit</td>
</tr>
<tr>
<td>3</td>
<td>policy-map policy-map-name</td>
<td>Create a policy map by entering the policy map name, and enter policy-map configuration mode. By default, no policy maps are defined. The default behavior of a policy map is to set the DSCP to 0 if the packet is an IP packet and to set the CoS to 0 if the packet is tagged. No policing is performed.</td>
</tr>
<tr>
<td>4</td>
<td>class class-map-name [access-group name acl-index-or-name]</td>
<td>Define a traffic classification, and enter policy-map class configuration mode. By default, no policy map class maps are defined. If a traffic class has already been defined by using the class-map global configuration command, specify its name for class-map-name in this command. For access-group name acl-index-or-name, specify the number or name of the ACL created in Step 2. Note In a policy map, the class named class-default is not supported. The switch does not filter traffic based on the policy map defined by the class class-default policy-map configuration command.</td>
</tr>
</tbody>
</table>
To delete an existing policy map, use the `no policy-map policy-map-name` global configuration command. To delete an existing class map, use the `no class class-map-name` policy-map configuration command. To remove an assigned DSCP value, use the `no set ip dscp new-dscp` policy-map configuration command. To remove an existing policer, use the `no police rate-bps burst-byte [exceed-action drop | dscp dscp-value]` policy-map configuration command. To remove the policy map and interface association, use the `no service-policy input policy-map-name` interface configuration command.

For details about configuring policy maps and security ACLs on the same interface, see Table 29-5 on page 29-18.

This example shows how to create a policy map and attach it to an ingress interface. In the configuration, the IP standard ACL permits traffic from network 10.1.0.0. For traffic matching this classification, the DSCP value in the incoming packet is trusted. If the matched traffic exceeds an average traffic rate of 500000 bps and a normal burst size of 8192 bytes, its DSCP is marked down to a value of 10 and sent.
Configuring Standard QoS

Configuring Standard QoS

Switch(config)# access-list 1 permit 10.1.0.0 0.0.255.255
Switch(config)# class-map ipclass1
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# policy-map flow1t
Switch(config-pmap)# class ipclass1
Switch(config-pmap-c)# police 5000000 8192 exceed-action dscp 10
Switch(config-pmap-c)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport mode access
Switch(config-if)# service-policy input flow1t

This example shows how to create a Layer 2 MAC ACL with two permit statements and attach it to an ingress interface. The first permit statement allows traffic from the host with MAC address 0001.0000.0001 destined for the host with MAC address 0002.0000.0001.

Switch(config)# mac access-list extended maclist1
Switch(config-ext-mac)# permit host 0001.0000.0001 host 0002.0000.0001
Switch(config-ext-mac)# exit
Switch(config)# mac access-list extended maclist2
Switch(config-ext-mac)# permit host 0001.0000.0003 host 0002.0000.0003
Switch(config-ext-mac)# exit
Switch(config)# class-map macclass1
Switch(config-cmap)# match access-group name maclist1
Switch(config-cmap)# exit
Switch(config)# policy-map macpolicy1
Switch(config-pmap)# class macclass1
Switch(config-pmap-c)# set ip dscp 56
Switch(config-pmap-c)# exit
Switch(config)# class-map macclass2 maclist2
Switch(config-pmap-c)# set ip dscp 48
Switch(config-pmap-c)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport mode trunk
Switch(config-if)# mls qos trust cos
Switch(config-if)# service-policy input macpolicy1

Configuring CoS Maps

Note

This feature is available only if your switch is running the EI.

This section describes how to configure the CoS maps:

- Configuring the CoS-to-DSCP Map, page 29-32
- Configuring the DSCP-to-CoS Map, page 29-33

All the maps are globally defined.

Configuring the CoS-to-DSCP Map

You use the CoS-to-DSCP map to map CoS values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic.

Table 29-7 shows the default CoS-to-DSCP map.
Beginning in privileged EXEC mode, follow these steps to modify the CoS-to-DSCP map:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 mls qos map cos-dscp dscp1...dscp8</td>
<td>Modify the CoS-to-DSCP map.</td>
</tr>
<tr>
<td></td>
<td>For dscp1...dscp8, enter 8 DSCP values that</td>
</tr>
<tr>
<td></td>
<td>correspond to CoS values 0 to 7. Separate</td>
</tr>
<tr>
<td></td>
<td>each DSCP value with a space.</td>
</tr>
<tr>
<td></td>
<td>The supported DSCP values are 0, 8, 10, 16,</td>
</tr>
<tr>
<td></td>
<td>24, 32, 34, 40, 46, 48, and 56.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show mls qos maps cos-dscp</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the</td>
</tr>
<tr>
<td></td>
<td>configuration file.</td>
</tr>
</tbody>
</table>

To return to the default map, use the no mls qos map cos-dscp global configuration command.

This example shows how to modify and display the CoS-to-DSCP map:

```
Switch# configure terminal
Switch(config)# mls qos map cos-dscp 8 8 8 8 24 32 56 56
Switch(config)# end
Switch# show mls qos maps cos-dscp
.Cos-dscp map:
  cos:  0 1 2 3 4 5 6 7
  ------------------------
dscp:  8 8 8 8 24 32 56 56
```

### Configuring the DSCP-to-CoS Map

You use the DSCP-to-CoS map to map DSCP values in incoming packets to a CoS value, which is used to select one of the four egress queues.

The switch supports these DSCP values: 0, 8, 10, 16, 18, 24, 26, 32, 34, 40, 46, 48, and 56.

Table 29-8 shows the default DSCP-to-CoS map.
If these values are not appropriate for your network, you need to modify them.

Beginning in privileged EXEC mode, follow these steps to modify the DSCP-to-CoS map:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>mls qos map dscp-cos dscp-list to cos</td>
</tr>
<tr>
<td></td>
<td>For dscp-list, enter up to 13 DSCP values separated by spaces. Then enter the to keyword.</td>
</tr>
<tr>
<td></td>
<td>For cos, enter the CoS value to which the DSCP values correspond.</td>
</tr>
<tr>
<td></td>
<td>The supported DSCP values are 0, 8, 10, 16, 18, 24, 26, 32, 34, 40, 46, 48, and 56. The CoS range is 0 to 7.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show mls qos maps dscp-cos</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default map, use the no mls qos map dscp-cos global configuration command.

This example shows how the DSCP values 26 and 48 are mapped to CoS value 7. For the remaining DSCP values, the DSCP-to-CoS mapping is the default.

Switch(config)# mls qos map dscp-cos 26 48 to 7
Switch(config)# exit

Switch# show mls qos maps dscp-cos

Dscp-cos map:
  dscp:  0  8 10 16 18 24 26 32 34 40 46 48 56
  cos:  0 1 1 2 2 3 4 4 5 5 5 7 7

Table 29-8  Default DSCP-to-CoS Map

<table>
<thead>
<tr>
<th>DSCP Values</th>
<th>CoS Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>8, 10</td>
<td>1</td>
</tr>
<tr>
<td>16, 18</td>
<td>2</td>
</tr>
<tr>
<td>24, 26</td>
<td>3</td>
</tr>
<tr>
<td>32, 34</td>
<td>4</td>
</tr>
<tr>
<td>40, 46</td>
<td>5</td>
</tr>
<tr>
<td>48</td>
<td>6</td>
</tr>
<tr>

<td>7</td>
</tr>
</tbody>
</table>
Configuring the Egress Queues

This feature is supported by both the SI and EI.

This section describes how to configure the egress queues:

- Configuring CoS Priority Queues, page 29-35
- Configuring WRR Priority, page 29-35
- Enabling the Expedite Queue and Configuring WRR Priority, page 29-36

For more information about the egress queues, see the “Egress CoS Queues” section on page 29-8.

Configuring CoS Priority Queues

Beginning in privileged EXEC mode, follow these steps to configure the CoS priority queues:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>wrr-queue cos-map qid cos1...cosn</td>
<td>Specify the queue ID of the CoS priority queue. (Ranges are 1 to 4 where 1 is the lowest CoS priority queue.) Specify the CoS values that are mapped to the queue id. Default values are as follows: CoS Value CoS Priority Queues 0, 11 2, 32 4, 53 6, 74</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>show wrr-queue cos-map</td>
<td>Display the mapping of the CoS priority queues.</td>
</tr>
</tbody>
</table>

To disable the new CoS settings and return to default settings, use the no wrr-queue cos-map global configuration command.

Configuring WRR Priority

Beginning in privileged EXEC mode, follow these steps to configure the WRR priority:
Chapter 29  Configuring QoS

Displaying Standard QoS Information

To display standard QoS information, use one or more of the privileged EXEC commands in Table 29-9:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show class-map [class-map-name]</td>
<td>Display QoS class maps, which define the match criteria to classify traffic.</td>
</tr>
<tr>
<td>show policy-map [policy-map-name [class class-name]]</td>
<td>Display QoS policy maps, which define classification criteria for incoming traffic.</td>
</tr>
</tbody>
</table>
### Table 29-9 Commands for Displaying QoS Information (continued)

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show mls qos maps [cos-dscp</td>
<td>dscp-cos]`</td>
</tr>
<tr>
<td><code>show mls qos interface [interface-id] [policers]</code></td>
<td>Display QoS information at the interface level, including the configuration of the egress queues and the CoS-to-egress-queue map, which interfaces have configured policers, and ingress statistics.</td>
</tr>
<tr>
<td>`show mls masks [qos</td>
<td>security]`</td>
</tr>
<tr>
<td><code>show wrq-queue cos-map</code></td>
<td>Display the mapping of the CoS priority queues.</td>
</tr>
<tr>
<td><code>show wrq-queue bandwidth</code></td>
<td>Display the WRR bandwidth allocation for the CoS priority queues.</td>
</tr>
</tbody>
</table>

1. Available only on a switch running the EI.
2. Access control parameters are called masks in the switch CLI commands and output.

---

### Standard QoS Configuration Examples

**Note**

These examples are applicable only if your switch is running the EI.

This section shows a QoS migration path to help you quickly implement QoS features based on your existing network and planned changes to your network, as shown in Figure 29-5. It contains this information:

- QoS Configuration for the Existing Wiring Closet, page 29-38
- QoS Configuration for the Intelligent Wiring Closet, page 29-39
QoS Configuration for the Existing Wiring Closet

Figure 29-5 shows an existing wiring closet with Catalyst 2900 XL and 3500 XL switches, for example. These switches are running Cisco IOS Release 12.0(5)XP or later, which supports the QoS-based IEEE 802.1p CoS values. QoS classifies frames by assigning priority-indexed CoS values to them and gives preference to higher-priority traffic.

Recall that on the Catalyst 2900 and 3500 XL switches, you can classify untagged (native) Ethernet frames at the ingress ports by setting a default CoS priority (switchport priority default default-priority-id interface configuration command) for each port. For IEEE 802.1Q frames with tag information, the priority value from the header frame is used. On the Catalyst 3524-PWR XL and 3548 XL switches, you can override this priority with the default value by using the switchport priority default override interface configuration command. For Catalyst 2950 and Catalyst 2900 XL switches and other 3500 XL models that do not have the override feature, the Catalyst 3550-12T switch at the distribution layer can override the IEEE 802.1p CoS value by using the mls qos cos override interface configuration command.
For the Catalyst 2900 and 3500 XL switches, CoS configures each transmit port (the egress port) with a normal-priority transmit queue and a high-priority transmit queue, depending on the frame tag or the port information. Frames in the normal-priority queue are forwarded only after frames in the high-priority queue are forwarded. Frames that have IEEE 802.1p CoS values of 0 to 3 are placed in the normal-priority transmit queue while frames with CoS values of 4 to 7 are placed in the expedite (high-priority) queue.

**QoS Configuration for the Intelligent Wiring Closet**

Figure 29-5 shows an intelligent wiring closet with Catalyst 2950 switches, for example. One of the switches is connected to a video server, which has an IP address of 172.20.10.16.

The object of this example is to prioritize the video traffic over all other traffic. To do so, a DSCP of 46 is assigned to the video traffic. This traffic is stored in queue 4, which is serviced more frequently than the other queues.

Beginning in privileged EXEC mode, follow these steps to configure the switch to prioritize video packets over all other traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 access-list 1 permit 172.20.10.16</td>
<td>Define an IP standard ACL, and permit traffic from the video server at 172.20.10.16.</td>
</tr>
<tr>
<td>Step 3 class-map videoclass</td>
<td>Create a class map called videoclass, and enter class-map configuration mode.</td>
</tr>
<tr>
<td>Step 4 match access-group 1</td>
<td>Define the match criterion by matching the traffic specified by ACL 1.</td>
</tr>
<tr>
<td>Step 5 exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>Step 6 policy-map videopolicy</td>
<td>Create a policy map called videopolicy, and enter policy-map configuration mode.</td>
</tr>
<tr>
<td>Step 7 class videoclass</td>
<td>Specify the class on which to act, and enter policy-map class configuration mode.</td>
</tr>
<tr>
<td>Step 8 set ip dscp 46</td>
<td>For traffic matching ACL 1, set the DSCP of incoming packets to 46.</td>
</tr>
<tr>
<td>Step 9 police 5000000 8192 exceed-action drop</td>
<td>Define a policer for the classified video traffic to drop traffic that exceeds 5-Mbps average traffic rate with an 8192-byte burst size.</td>
</tr>
<tr>
<td>Step 10 exit</td>
<td>Return to policy-map configuration mode.</td>
</tr>
<tr>
<td>Step 11 exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>Step 12 interface interface-id</td>
<td>Specify the switch ingress interface that is connected to the video server, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 13 service-policy input videopolicy</td>
<td>Apply the policy to the ingress interface.</td>
</tr>
<tr>
<td>Step 14 exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>Step 15 wrr-queue bandwidth 1 2 3 4</td>
<td>Assign a higher WRR weight to queue 4.</td>
</tr>
<tr>
<td>Step 16 wrr-queue cos-map 4 6 7</td>

### Standard QoS Configuration Examples

#### Step 18
- `show class-map videoclass`
- `show policy-map videopolicy`
- `show mls qos maps [cos-dscp | dscp-cos]`

**Purpose:** Verify your entries.

#### Step 19
- `copy running-config startup-config`

**Purpose:** (Optional) Save your entries in the configuration file.
Configuring EtherChannels

This chapter describes how to configure EtherChannel on the Layer 2 interfaces of a Catalyst 2950 or Catalyst 2955 switch.

This chapter consists of these sections:
- Understanding EtherChannels, page 30-1
- EtherChannel On Mode, page 30-6
- Configuring EtherChannels, page 30-7
- Displaying EtherChannel, PAgP, and LACP Status, page 30-14

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

Understanding EtherChannels

EtherChannel provides fault-tolerant high-speed links between switches, routers, and servers. You can use it to increase the bandwidth among the wiring closets and the data center, and you can deploy it anywhere in the network where bottlenecks are likely to occur. EtherChannel provides automatic recovery for the loss of a link by redistributing the load across the remaining links. If a link fails, EtherChannel redirects traffic from the failed link to the remaining links in the channel without intervention.

An EtherChannel consists of individual Fast Ethernet or Gigabit Ethernet links bundled into a single logical link as shown in Figure 30-1. The EtherChannel provides full-duplex bandwidth up to 800 Mbps (Fast EtherChannel) or 2 Gbps (Gigabit EtherChannel) between your switch and another switch or host.
Each EtherChannel can consist of up to eight compatibly configured Ethernet interfaces. All interfaces in each EtherChannel must be the same speed, and all must be configured as Layer 2 interfaces.

**Note**

The network device to which your switch is connected can impose its own limits on the number of interfaces in the EtherChannel. For Catalyst 2950 and Catalyst 2955 switches, the number of EtherChannels is limited to six with eight ports per EtherChannel.

You can configure an EtherChannel in one of these modes: Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or On mode. Configure both ends of the EtherChannel in the same mode:

- When you configure one end of an EtherChannel in either PAgP or LACP mode, the system negotiates with the other end of the channel to determine which ports should become active. Incompatible ports are suspended.
- When you configure an EtherChannel in the on mode, no negotiations take place. The switch forces all compatible ports to become active in the EtherChannel. The other end of the channel (on the other switch) must also be configured in the on mode; otherwise, packet loss can occur.

If a link within an EtherChannel fails, traffic previously carried over that failed link moves to the remaining links within the EtherChannel. If traps are enabled on the switch, a trap is sent for a failure that identifies the switch, the EtherChannel, and the failed link. Inbound broadcast and multicast packets on one link in an EtherChannel are blocked from returning on any other link of the EtherChannel.
### Understanding Port-Channel Interfaces

When you create an EtherChannel for Layer 2 interfaces, a logical interface is dynamically created, as shown in Figure 30-2. You then manually assign an interface to the EtherChannel by using the `channel-group` interface configuration command.

Each EtherChannel has a logical port-channel interface numbered from 1 to 6.

**Note** Configuration changes made to the logical interface of an EtherChannel may not propagate to all the member ports of the channel.

### Understanding the Port Aggregation Protocol and Link Aggregation Protocol

The Port Aggregation Protocol (PAgP) and Link Aggregation Control Protocol (LACP) facilitate the automatic creation of EtherChannels by exchanging packets between Ethernet interfaces. PAgP is a Cisco-proprietary protocol that can be run only on Cisco switches and on those switches licensed by licensed vendors to support PAgP. LACP is defined in IEEE 802.3ad and allows Cisco switches to manage Ethernet channels between switches that conform to the IEEE 802.3ad protocol.

By using one of these protocols, a switch learns the identity of partners capable of supporting either PAgP or LACP and learns the capabilities of each interface. It then dynamically groups similarly configured interfaces into a single logical link (channel or aggregate port); these interfaces are grouped based on hardware, administrative, and port parameter constraints. For example, PAgP groups the interfaces with the same speed, duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, PAgP adds the group to the spanning tree as a single switch port.
Chapter 30  Configuring EtherChannels

Understanding EtherChannels

Table 30-1 shows the user-configurable EtherChannel modes for the `channel-group` interface configuration command. Switch interfaces exchange PAgP packets only with partner interfaces configured in the `auto` or `desirable` modes. Switch interfaces exchange LACP packets only with partner interfaces configured in the `active` or `passive` modes. Interfaces configured in the `on` mode do not exchange PAgP or LACP packets.

Table 30-1  EtherChannel Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active</td>
<td>Places an interface into an active negotiating state, in which the interface starts negotiations with other interfaces by sending LACP packets.</td>
</tr>
<tr>
<td>auto</td>
<td>Places an interface into a passive negotiating state, in which the interface responds to PAgP packets it receives but does not start PAgP packet negotiation. This setting minimizes the transmission of PAgP packets.</td>
</tr>
<tr>
<td>desirable</td>
<td>Places an interface into an active negotiating state, in which the interface starts negotiations with other interfaces by sending PAgP packets.</td>
</tr>
<tr>
<td>passive</td>
<td>Places an interface into a passive negotiating state, in which the interface responds to LACP packets that it receives, but does not start LACP packet negotiation. This setting minimizes the transmission of LACP packets.</td>
</tr>
</tbody>
</table>

Exchanging PAgP Packets

Both the `auto` and `desirable` PAgP modes allow interfaces to negotiate with partner interfaces to determine if they can form an EtherChannel based on criteria such as interface speed and, for Layer 2 EtherChannels, trunking state and VLAN numbers.

Interfaces can form an EtherChannel when they are in different PAgP modes as long as the modes are compatible. For example:

- An interface in the `desirable` mode can form an EtherChannel with another interface that is in the `desirable` or `auto` mode.
- An interface in the `auto` mode can form an EtherChannel with another interface in the `desirable` mode.

An interface in the `auto` mode cannot form an EtherChannel with another interface that is also in the `auto` mode because neither interface starts PAgP negotiation.

If your switch is connected to a partner that is PAgP-capable, you can configure the switch interface for nonsilent operation by using the `non-silent` keyword. If you do not specify `non-silent` with the `auto` or `desirable` mode, silent mode is assumed.

The silent mode is used when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. An example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port connected to a silent partner prevents that switch port from ever becoming operational; however, the silent setting allows PAgP to operate, to attach the interface to a channel group, and to use the interface for transmission.

Note

An EtherChannel cannot be configured in both the PAgP and LACP modes.
Exchanging LACP Packets

Both the active and passive LACP modes allow interfaces to negotiate with partner interfaces to determine if they can form an EtherChannel based on criteria such as interface speed and, for Layer 2 EtherChannels, trunking state, and VLAN numbers.

Interfaces can form an EtherChannel when they are in different LACP modes as long as the modes are compatible. For example:

- An interface in the active mode can form an EtherChannel with another interface that is in the active mode.
- An interface in the active mode can form an EtherChannel with another interface in the passive mode.

An interface in the passive mode cannot form an EtherChannel with another interface that is also in the passive mode because neither interface starts LACP negotiation.

Note

An EtherChannel cannot be configured in both the PAgP and LACP modes.

Physical Learners and Aggregate-Port Learners

Network devices are classified as PAgP physical learners or aggregate-port learners. A device is a physical learner if it learns addresses by physical ports and directs transmissions based on that knowledge. A device is an aggregate-port learner if it learns addresses by aggregate (logical) ports.

When a device and its partner are both aggregate-port learners, they learn the address on the logical port-channel. The device sends packets to the source by using any of the interfaces in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives.

The switch uses source-MAC address distribution for a channel if it is connected to a physical learner even if you configure the switch for destination-MAC address distribution.

These frame distribution mechanisms are possible for frame transmission:

- Load distribution based on the source-MAC address of the packet
- Load distribution based on the destination-MAC address of the packet

The switch supports up to eight ports in a PAgP group.

PAgP and LACP Interaction with Other Features

The Dynamic Trunking Protocol (DTP) and Cisco Discovery Protocol (CDP) send and receive packets over the physical interfaces in the EtherChannel. Trunk ports send and receive PAgP and LACP protocol data units (PDUs) on the lowest numbered VLAN.

Spanning tree sends packets over a single physical interface in the EtherChannel, regarding the EtherChannel as one port.

PAgP sends and receives PAgP PDUs only from interfaces that have PAgP enabled for the auto or desirable mode. LACP sends and receives LACP PDUs only from interfaces that have LACP enabled for the active or passive mode.
EtherChannel On Mode

EtherChannel on mode can be used to manually configure an EtherChannel. The on mode forces a port to join an EtherChannel without negotiations. It can be useful if the remote device does not support PAgP or LACP. With the on mode, a usable EtherChannel exists only when both ends of the link are configured in the on mode.

This mode is not available on Long-Reach Ethernet (LRE) switches, because LRE interfaces do not support an EtherChannel-only mode.

Ports that are configured with on mode in the same channel group must have compatible port characteristics, such as speed and duplex. Ports that are not compatible are suspended, even though they are configured with on mode.

Caution
You should exercise care when using the on mode. This is a manual configuration, and ports on both ends of the EtherChannel must have a similar configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

Understanding Load Balancing and Forwarding Methods

EtherChannel balances the traffic load across the links in a channel by randomly associating a newly learned MAC address with one of the links in the channel.

With source-MAC address forwarding, packets forwarded to an EtherChannel are distributed across the ports in the channel based on the source-MAC address of the incoming packet. Therefore, to provide load balancing, packets from different hosts use different ports in the channel, but packets from the same host use the same port in the channel. The MAC address learned by the switch does not change).

With destination-MAC address forwarding, packets forwarded to an EtherChannel are distributed across the ports in the channel based on the destination host MAC address of the incoming packet. Therefore, packets to the same destination are forwarded over the same port, and packets to a different destination might be sent on a different port in the channel. You configure the load balancing and forwarding method by using the port-channel load-balance global configuration command.

In Figure 30-3, multiple workstations are connected to a switch, and an EtherChannel connects the switch to the router. Source-based load balancing is used on the switch end of the EtherChannel to ensure that the switch efficiently uses the bandwidth of the router by distributing traffic from the workstation across the physical links. Since the router is a single MAC address device, it uses destination-based load balancing to efficiently spread the traffic to the workstations across the physical links in the EtherChannel.
Configuring EtherChannels

These sections describe how to configure EtherChannel interfaces:

- Default EtherChannel Configuration, page 30-8
- EtherChannel Configuration Guidelines, page 30-8
- Configuring Layer 2 EtherChannels, page 30-9
- Configuring EtherChannel Load Balancing, page 30-11
- Configuring the PAgP Learn Method and Priority, page 30-12

**Note**
Make sure that the interfaces are correctly configured (see the “EtherChannel Configuration Guidelines” section on page 30-8).

**Note**
After you configure an EtherChannel, configuration changes applied to the port-channel interface apply to all the physical interfaces assigned to the port-channel interface, and configuration changes applied to the physical interface affect only the interface where you apply the configuration.
Default EtherChannel Configuration

Table 30-2 shows the default EtherChannel configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel groups</td>
<td>None assigned.</td>
</tr>
<tr>
<td>PAgP mode</td>
<td>No default.</td>
</tr>
<tr>
<td>PAgP learn method</td>
<td>Aggregate-port learning on all interfaces.</td>
</tr>
<tr>
<td>PAgP priority</td>
<td>128 on all interfaces. (Changing this value has no effect.)</td>

<td>LACP priority</td>
<td>32768 on all interfaces.</td>
</tr>
<tr>
<td>Load balancing</td>
<td>Load distribution on the switch is based on the source-MAC address of the incoming packet.</td>
</tr>
</tbody>
</table>

EtherChannel Configuration Guidelines

If improperly configured, some EtherChannel ports are automatically disabled to avoid network loops and other problems. Follow these guidelines to avoid configuration problems:

- Configure an EtherChannel with up to eight Ethernet ports of the same type.

  **Note** Do not configure a GigaStack GBIC port as part of an EtherChannel.

- Configure all ports in an EtherChannel to operate at the same speeds and duplex modes.
- Enable all interfaces in an EtherChannel. A port in an EtherChannel that is disabled by using the `shutdown` interface configuration command is treated as a link failure, and its traffic is transferred to one of the remaining interfaces in the EtherChannel.
- When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, you must also make the changes to all ports in the group:
  - Allowed-VLAN list
  - Spanning-tree path cost for each VLAN
  - Spanning-tree port priority for each VLAN
  - Spanning-tree Port Fast setting
- Do not configure a secure port as part of an EtherChannel or the reverse.
- Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x on an EtherChannel port, an error message appears, and IEEE 802.1x is not enabled.
- If EtherChannels are configured on switch interfaces, remove the EtherChannel configuration from the interfaces before globally enabling IEEE 802.1x on a switch by using the `dot1x system-auth-control` global configuration command.
• An EtherChannel supports the same allowed range of VLANs on all the interfaces in a trunking Layer 2 EtherChannel. When configuring an interface for PAgP, if the allowed range of VLANs is not the same, the interfaces do not form an EtherChannel even when PAgP is set to the auto or desirable mode. When configuring an interface for LACP, if the allowed range of VLANs is not the same, the interfaces do not form an EtherChannel even when LACP is set to the active or passive mode.

• Interfaces with different spanning-tree path costs can form an EtherChannel if they are otherwise compatibly configured. Setting different spanning-tree path costs does not, by itself, make interfaces incompatible for the formation of an EtherChannel.

• Configure only PAgP-type EtherChannels on Catalyst 2950 Long-Reach Ethernet (LRE) switch ports.

### Configuring Layer 2 EtherChannels

You configure Layer 2 EtherChannels by configuring the Ethernet interfaces with the channel-group interface configuration command, which creates the port-channel logical interface. You cannot put a Layer 2 interface into a manually created port-channel interface.

**Note**
Layer 2 interfaces must be connected and functioning for the software to create port-channel interfaces.

Beginning in privileged EXEC mode, follow these steps to assign a Layer 2 Ethernet interface to a Layer 2 EtherChannel:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify a physical interface to configure, and enter interface configuration mode. Valid interfaces include physical interfaces. Up to eight interfaces of the same type and speed can be configured for the same group.</td>
</tr>
<tr>
<td>switchport mode [access</td>
<td>Assign all interfaces as static-access ports in the same VLAN, or configure them as trunks. If you configure the interface as a static-access port, assign it to only one VLAN. The range is 1 to 4094.</td>
</tr>
<tr>
<td>trunk]</td>
<td></td>
</tr>
<tr>
<td>switchport access vlan</td>
<td></td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td></td>
</tr>
</tbody>
</table>
Configuring EtherChannels

### Step 4

**Command**

```
channel-group channel-group-number mode
{ [ auto [ non-silent ] | desirable [ non-silent ] | on ] | 
  { active | passive } }
```

**Purpose**

Assign the port to a channel group, and specify the PAgP or LACP mode.

For `channel-group-number`, the range is 1 to 6. Each EtherChannel can have up to eight compatibly configured Ethernet interfaces.

For `mode`, select one of these keywords:

- **auto**—Enables PAgP only if a PAgP device is detected. It places an interface into a passive negotiating state, in which the interface responds to PAgP packets it receives but does not start PAgP packet negotiation.

- **desirable**—Unconditionally enables PAgP. It places an interface into an active negotiating state, in which the interface starts negotiations with other interfaces by sending PAgP packets.

- **on**—Forces the interface to channel without PAgP. With the on mode, a usable EtherChannel exists only when an interface group in the on mode is connected to another interface group in the on mode.

- **non-silent**—If your switch is connected to a partner that is PAgP-capable, you can configure the switch interface for nonsilent operation. You can configure an interface with the non-silent keyword for use with the auto or desirable mode. If you do not specify non-silent with the auto or desirable mode, silent is assumed. The silent setting is for connections to file servers or packet analyzers. This setting allows PAgP to operate, to attach the interface to a channel group, and to use the interface for transmission.

- **active**—Enables LACP only if an LACP device is detected. It places an interface into an active negotiating state, in which the interface starts negotiations with other interfaces by sending LACP packets.

- **passive**—Enables LACP on an interface and places it into a passive negotiating state, in which the interface responds to LACP packets that it receives, but does not start LACP packet negotiation.

For information on compatible PAgP and LACP modes for the switch and its partner, see the “PAgP and LACP Modes” section on page 30-4.

### Step 5

**Command**

`end`

**Purpose**

Return to privileged EXEC mode.

### Step 6

**Command**

`show running-config`

**Purpose**

Verify your entries.

### Step 7

**Command**

`copy running-config startup-config`

**Purpose**

(Optional) Save your entries in the configuration file.
To remove a port from the EtherChannel group, use the `no channel-group` interface configuration command. If you delete the EtherChannel by using the `no interface port-channel` global configuration command without removing the physical interfaces, the physical interfaces are shutdown. If you do not want the member physical interfaces to shut down, remove the physical interfaces before deleting the EtherChannel.

This example shows how to assign a range of interfaces as static-access ports in VLAN 10 to channel 5 with the PAgP mode `desirable`:

```
Switch# configure terminal
Switch(config)# interface range fastethernet0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode desirable
Switch(config-if-range)# end
```

### Configuring EtherChannel Load Balancing

This section describes how to configure EtherChannel load balancing by using source-based or destination-based forwarding methods. For more information, see the “Understanding Load Balancing and Forwarding Methods” section on page 30-6.

Beginning in privileged EXEC mode, follow these steps to configure EtherChannel load balancing:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>port-channel load-balance <em>method</em></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
</tbody>
</table>
To return EtherChannel load balancing to the default configuration, use the `no port-channel load-balance` global configuration command.

### Configuring the PAgP Learn Method and Priority

Network devices are classified as PAgP physical learners or aggregate-port learners. A device is a physical learner if it learns addresses by physical ports and directs transmissions based on that knowledge. A device is an aggregate-port learner if it learns addresses by aggregate ports.

For compatibility with Catalyst 1900 series switches, configure the Catalyst 2950 and Catalyst 2955 switch for source-MAC load distribution.

The Catalyst 2950 or Catalyst 2955 switch supports address learning only on aggregate ports even though the `physical-port` keyword is provided in the command-line interface (CLI). The `pagp learn-method` and the `pagp port-priority` interface configuration command have no effect on the switch hardware.

**Note**

You should not set the learn method to `physical-port` because the switch is an aggregate-learning device.

If the link partner to the switch is a physical learner that has the `channel-group` interface configuration command set to `auto` or `desirable`, the switch automatically uses the load-distribution method based on the source-MAC address, regardless of the configured load distribution method.

If the link partner to the Catalyst 2950 or Catalyst 2955 switch is a physical learner that has the `channel-group` interface configuration command set to `on`, set the load-distribution method based on the source-MAC address by using the `port-channel load-balance src-mac` global configuration command.

### Configuring the LACP Port Priority

You can set the priority for each port in an EtherChannel that is configured for LACP by using the `lACP port-priority` privileged EXEC command. The range is from 1 to 65535. Beginning in privileged EXEC mode, follow these steps to configure the LACP port priority:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specify the interface for transmission, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> lACP port-priority priority-value</td>
<td>Select the LACP port priority value. For priority-value, the range is 1 to 65535. By default, the priority value is 32768. The lower the range, the more likely that the interface will be used for LACP transmission.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Chapter 30  Configuring EtherChannels

Configuring EtherChannels

Configuring Hot Standby Ports

When enabled, LACP tries to configure the maximum number of LACP-compatible ports in a channel, up to a maximum of 16 ports. Only eight LACP links can be active at one time. Any additional links are put in a hot standby state. If one of the active links becomes inactive, a link that is in hot standby mode becomes active in its place.

If more than eight links are configured for an EtherChannel group, the software determines which of the hot standby ports to make active based on:

- LACP port-priority
- Port ID

All ports default to the same port priority. You can change the port priority of LACP EtherChannel ports to specify which hot standby links become active first by using the `lacp port-priority interface` configuration command to set the port priority to a value lower than the default of 32768.

The hot standby ports that have lower port numbers become active in the channel first unless the port priority is configured to be a lower number than the default value of 32768.

Note

If LACP is not able to aggregate all the ports that are compatible (for example, the remote system might have more restrictive hardware limitations), all the ports that cannot be actively included in the EtherChannel are put in hot standby state and are used only if one of the channeled ports fails.

Configuring the LACP System Priority

You can set the system priority for all of the EtherChannels that are configured for LACP by using the `lacp system-priority` privileged EXEC command. The range is from 1 to 65535.

Note

The `lacp system-priority` command is global. You cannot set a system priority for each LACP-configured channel separately.

We recommend using this command only when there are a combination of LACP-configured EtherChannels that are in both active and standby modes.

Beginning in privileged EXEC mode, follow these steps to configure the LACP system priority:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5</td>
<td>show running-config or show lacp channel-group-number internal</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Chapter 30  Configuring EtherChannels

Displaying EtherChannel, PAgP, and LACP Status

You can use the privileged EXEC commands described in Table 30-3 to display EtherChannel, PAgP, and LACP status information:

Table 30-3  Commands for Displaying EtherChannel, PAgP, and LACP Status

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show etherchannel [channel-group-number] {detail</td>
<td>load-balance</td>
</tr>
<tr>
<td>`show pagp [channel-group-number] {counters</td>
<td>internal</td>
</tr>
<tr>
<td>`show lacp [channel-group-number] {counters</td>
<td>internal</td>
</tr>
</tbody>
</table>

1. You can clear PAgP channel-group information and traffic filters by using the `clear pagp {channel-group-number [counters] | counters}` privileged EXEC command.
2. You can clear LACP channel-group information and traffic filters by using the `clear lacp {channel-group-number [counters] | counters}` privileged EXEC command.

For detailed information about the fields in the command outputs, see the command reference for this release.
Troubleshooting

This chapter describes how to identify and resolve Catalyst 2950 and Catalyst 2955 software problems related to the Cisco IOS software. Depending on the nature of the problem, you can use the command-line interface (CLI), the device manager, or to identify and solve problems. To identify and resolve Cisco Course Wave Division Multiplexer (CWDM) Gigabit Interface Converter (GBIC) problems, you must have the enhanced software image (EI) installed on your non-Long-Reach Ethernet (LRE) Catalyst 2950 switch.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the Cisco IOS Command Summary for Cisco IOS Release 12.1.

This chapter consists of these sections:
- Using Recovery Procedures, page 31-1
- Preventing Autonegotiation Mismatches, page 31-13
- GBIC and SFP Module Security and Identification, page 31-14
- Diagnosing Connectivity Problems, page 31-14
- Diagnosing LRE Connection Problems, page 31-17
- Using Debug Commands, page 31-18
- Using the show controllers Commands, page 31-21
- Using the crashinfo File, page 31-21

Using Recovery Procedures

These recovery procedures require that you have physical access to the switch:
- Recovering from a Software Failure, page 31-2
- Recovering from Lost or Forgotten Passwords on Non-LRE Catalyst 2950 Switches, page 31-2
- Recovering from Lost or Forgotten Passwords on Catalyst 2950 LRE Switches, page 31-4
- Recovering from Lost or Forgotten Passwords on Catalyst 2955 Switches, page 31-7
- Recovering from a Command Switch Failure, page 31-10
- Recovering from Lost Member Connectivity, page 31-13
Recovering from a Software Failure

Switch software can be corrupted during an upgrade, by downloading the wrong file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

This procedure uses the Xmodem Protocol to recover from a corrupt or wrong image file. There are many software packages that support the Xmodem Protocol, and this procedure is largely dependent on the emulation software that you are using.

Follow these steps to recover from a software failure:

**Step 1** Connect a PC with terminal-emulation software supporting the Xmodem Protocol to the switch console port.

**Step 2** Set the line speed on the emulation software to 9600 baud.

**Step 3** Disconnect the switch power cord.

**Step 4** Reconnect the power cord to the switch. The software image does not load. The switch starts in boot loader mode, which is indicated by the `switch#` prompt.

**Step 5** Use the boot loader to enter commands, and start the transfer.

```
switch# copy xmodem: flash:image_filename.bin
```

**Step 6** When the Xmodem request appears, use the appropriate command on the terminal-emulation software to start the transfer and to copy the software image to flash memory.

Recovering from Lost or Forgotten Passwords on Non-LRE Catalyst 2950 Switches

Follow these steps if you have forgotten or lost the switch password on a non-LRE Catalyst 2950 switch:

**Step 1** Connect a terminal or PC with terminal emulation software to the consoleservice port. For more information, see the switch hardware installation guide.

**Note** You can configure your switch for Telnet by following the procedure in the "Accessing the CLI" section on page 2-9.

**Step 2** Set the line speed on the emulation software to 9600 baud.

**Step 3** Unplug the switch power cord.

**Step 4** Reconnect the power cord to the switch and, within 15 seconds, press the **Mode** button while the System LED above port 1X is still flashing green. Continue pressing the **Mode** button until the System LED turns briefly amber and then solid green; then release the **Mode** button.

Several lines of information about the software appear, as do instructions:

```
The system has been interrupted prior to initializing the flash file system. These commands will initialize the flash file system, and finish loading the operating system software:
```

31-2
**Step 5** Initialize the flash file system:

```
switch: flash_init
```

**Step 6** If you had set the console port speed to anything other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch consoleservice port.

**Step 7** Load any helper files:

```
switch: load_helper
```

**Step 8** Display the contents of flash memory:

```
switch: dir flash:
```

The switch file system appears in the directory.

**Step 9** Rename the configuration file to config.text.old. This file contains the password definition.

```
switch: rename flash:config.text flash:config.text.old
```

**Step 10** Boot the system:

```
switch: boot
```

You are prompted to start the setup program. Enter **N** at the prompt:

```
Continue with the configuration dialog? [yes/no]: N
```

**Step 11** At the switch prompt, change to privileged EXEC mode:

```
switch> enable
```

**Step 12** Rename the configuration file to its original name:

```
switch# rename flash:config.text.old flash:config.text
```

**Step 13** Copy the configuration file into memory:

```
switch# copy flash:config.text system:running-config
```

Press **Return** in response to the confirmation prompts.

The configuration file is now reloaded, and you can use the following normal commands to change the password.

**Step 14** Enter global configuration mode:

```
switch# configure terminal
```

**Step 15** Change the password:

```
switch(config)# enable secret <password>
```

or

```
switch(config)# enable password <password>
```
Step 16  Return to privileged EXEC mode:

```
switch(config)# exit
switch#
```

Step 17  Write the running configuration to the startup configuration file:

```
switch# copy running-config startup-config
```

The new password is now included in the startup configuration.

---

### Recovering from Lost or Forgotten Passwords on Catalyst 2950 LRE Switches

An end user with physical access to the switch can recover from a lost password by interrupting the boot process during power-on and by entering a new password. This is the default configuration for Catalyst 2940 Catalyst 2950 LRE switches.

**Note**

A system administrator can disable some of the functionality of the password recovery feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password and password recover has been disabled, a status message shows this during the recovery process.

Follow these steps if you have forgotten or lost the switch password:

**Step 1**  Connect a terminal or PC with terminal-emulation software to the switch console port.

**Note**  See the “Connecting the Console Port” and “Starting the Terminal Emulation Software” sections in “Appendix D, Configuring the Switch with the CLI-Based Setup Program.”

**Step 2**  Set the line speed on the emulation software to 9600 baud.

**Step 3**  Unplug the switch power cord.

**Step 4**  Reconnect the power cord to the switch and, within 15 seconds, press the Mode button while the System LED above port 1X is still flashing green. Continue pressing the Mode button until the System LED turns briefly amber and then solid green; then release the Mode button.

Several lines of information about the software appear with instructions, informing you if the password recovery procedure has been disabled or not.

- If you see a message that begins with this:

  > The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system

  go to the “Password Recovery with Password Recovery Enabled” section on page 31-5, and follow the steps.

- If you see a message that begins with this:

  > The password-recovery mechanism has been triggered, but is currently disabled.

  go to the “Procedure with Password Recovery Disabled” section on page 31-6, and follow the steps.
Password Recovery with Password Recovery Enabled

If the password-recovery mechanism is enabled, this message appears:

The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system software:

- flash_init
- load_helper
- boot

Follow these steps when the password-recovery is enabled:

**Step 1** Initialize the flash file system:
```
switch: flash_init
```

**Step 2** If you had set the console port speed to anything other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console serviceport.

**Step 3** Load any helper files:
```
switch: load_helper
```

**Step 4** Display the contents of flash memory:
```
switch: dir flash:
```

The switch file system appears in the directory.

**Step 5** Rename the configuration file to config.text.old.
This file contains the password definition.
```
switch: rename flash:config.text flash:config.text.old
```

**Step 6** Boot the system:
```
switch: boot
```

You are prompted to start the setup program. Enter N at the prompt:
```
Continue with the configuration dialog? [yes/no]: N
```

**Step 7** At the switch prompt, enter privileged EXEC mode:
```
Switch> enable
```

**Step 8** Rename the configuration file to its original name:
```
Switch# rename flash:config.text.old flash:config.text
```

**Step 9** Copy the configuration file into memory:
```
Switch# copy flash:config.text system:running-config
```

Source filename [config.text]?
Destination filename [running-config]?

Press Return in response to the confirmation prompts.
The configuration file is now reloaded, and you can change the password.

**Step 10** Enter global configuration mode:
```
Switch# configure terminal
```
Step 11 Change the password:

```
Switch (config)# enable secret password
```

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

Step 12 Return to privileged EXEC mode:

```
Switch (config)# exit
Switch#
```

Step 13 Write the running configuration to the startup configuration file:

```
Switch# copy running-config startup-config
```

The new password is now in the startup configuration.

Note This procedure is likely to leave your switch VLAN interface in a shutdown state. You can see which interface is in this state by entering the `show running-config` privileged EXEC command. To re-enable the interface, enter the `interface vlan vlan-id` global configuration command, and specify the VLAN ID of the shutdown interface. With the switch in interface configuration mode, enter the `no shutdown` command.

---

Procedure with Password Recovery Disabled

If the password-recovery mechanism is disabled, this message appears:

```
The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?
```

Caution Returning the switch to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup switch and VLAN configuration files.

- If you enter `n` (no), the normal boot process continues as if the `Mode` button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:
  
  Press Enter to continue.........

- If you enter `y` (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.

Follow these steps when the password-recovery mechanism is disabled:

Step 1 Elect to continue with password recovery and lose the existing configuration:

```
Would you like to reset the system back to the default configuration (y/n)? y
```
Step 2 Load any helper files:
Switch: load_helper

Step 3 Display the contents of flash memory:
switch: dir flash:
The switch file system appears in the directory.

Step 4 Boot the system:
Switch: boot
You are prompted to start the setup program. To continue with password recovery, enter N at the prompt:
Continue with the configuration dialog? [yes/no]: N

Step 5 At the switch prompt, enter privileged EXEC mode:
Switch> enable

Step 6 Enter global configuration mode:
Switch# configure terminal

Step 7 Change the password:
Switch (config)# enable secret password
The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

Step 8 Return to privileged EXEC mode:
Switch (config)# exit
Switch#

Step 9 Write the running configuration to the startup configuration file:
Switch# copy running-config startup-config
The new password is now in the startup configuration.

Note This procedure is likely to leave your switch VLAN interface in a shutdown state. You can see which interface is in this state by entering the show running-config privileged EXEC command. To re-enable the interface, enter the interface vlan vlan-id global configuration command, and specify the VLAN ID of the shutdown interface. With the switch in interface configuration mode, enter the no shutdown command.

Step 10 You must now reconfigure the switch. If the system administrator has the backup switch and VLAN configuration files available, you should use those.

Recovering from Lost or Forgotten Passwords on Catalyst 2955 Switches

The Catalyst 2955 switch boot loader uses break-key detection to stop the automatic boot sequence for the password recovery purpose.
Note

The break key character is different for each operating system.

On a SUN work station running UNIX, Ctrl-C is the break key.

On a PC running Windows 2000, Ctrl-Break is the break key.

Cisco TAC has tabulated break keys for most common operating systems and an alternative break key sequence for those terminal emulators that do not support the break keys. See http://www.cisco.com/warp/public/701/61.html#how-to for that list.

Follow these steps if you have forgotten or lost the switch password.

Step 1
Connect a terminal or PC with terminal emulation software to the console port. For more information, see the switch hardware installation guide.

Note
You can configure your switch for Telnet by following the procedure in the “Accessing the CLI” section on page 2-9.

Step 2
Set the line speed on the emulation software to 9600 baud.

Step 3
Connect the power cord to the switch, and apply power to the switch.

After the switch performs POST, the switch begins the autoboot process. The boot loader prompts the user for a break key character during the boot-up sequence, as shown in this example:

***** The system will autoboot in 15 seconds *****

Send a break key to prevent autobooting.

Step 4
When the boot loader prompts you, enter the break key.

This example shows the messages that appear on the console after the user enters a break key:

The system has been interrupted prior to initializing the flash file system.
The following commands will initialize the flash file system, and finish loading the operating system software:

flash_init
load_helper
boot

After the message appears, the boot loader prompt resumes.

On the Catalyst 2955C-12 and Catalyst 2955S-12 switches, the port 13 LED blinks green, and the port 14 LED is off during the initial appearance of the boot loader prompt. On the Catalyst 2955T-12 switch, the port 1 LED blinks green, and the port 2 LED is off during the initial appearance of the boot loader prompt.

Step 5
Initialize the flash file system:

switch# flash_init

Step 6
If you set the console port speed to anything other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

Step 7
Load any helper files:

switch# load_helper
Step 8  Display the contents of flash memory as in this example:

```
switch# dir flash:
Directory of flash:/
```

The switch file system appears in the directory.

Step 9  Rename the configuration file to config.text.old.
This file contains the password definition.

```
switch# rename flash:config.text flash:config.text.old
```

Step 10  Boot the system:

```
switch# boot
```

You are prompted to start the setup program. Enter N at the prompt:

```
Continue with the configuration dialog? [yes/no]: N
```

Step 11  At the switch prompt, change to privileged EXEC mode:

```
switch> enable
```

Step 12  Rename the configuration file to its original name:

```
switch# rename flash:config.text.old flash:config.text
```

Step 13  Copy the configuration file into memory:

```
switch# copy flash:config.text system:running-config
```

Press Return in response to the confirmation prompts.
The configuration file is now reloaded, and you can use these normal commands to change the password.

Step 14  Enter global configuration mode:

```
switch# configure terminal
```

Step 15  Change the password:

```
switch(config)# enable secret <password>
```

or

```
switch(config)# enable password <password>
```

Step 16  Return to privileged EXEC mode:

```
switch(config)# exit
switch#
```

Step 17  Write the running configuration to the startup configuration file:

```
switch# copy running-config startup-config
```

The new password is now included in the startup configuration.
Recovering from a Command Switch Failure

This section describes how to recover from a failed command switch. You can configure a redundant command switch group by using the Hot Standby Router Protocol (HSRP). For more information, see Chapter 6, “Clustering Switches”, and the Getting Started with Cisco Network Assistant, available on Cisco.com.

Note
HSRP is the preferred method for supplying redundancy to a cluster.

If you have not configured a standby command switch, and your command switch loses power or fails in some other way, management contact with the member switches is lost, and you must install a new command switch. However, connectivity between switches that are still connected is not affected, and the member switches forward packets as usual. You can manage the members as standalone switches through the console port, or, if they have IP addresses, through the other management interfaces.

You can prepare for a command switch failure by assigning an IP address to a member switch or another switch that is command-capable, making a note of the command-switch password, and cabling your cluster to have redundant connectivity between the member switches and the replacement command switch. This section describes two solutions for replacing a failed command switch:

- Replacing a failed command switch with a cluster member
- Replacing a failed command switch with another switch

For information on command-capable switches, see the release notes.

Replacing a Failed Command Switch with a Cluster Member

To replace a failed command switch with a command-capable member in the same cluster, follow these steps:

**Step 1** Disconnect the command switch from the member switches, and physically remove it from the cluster.

**Step 2** Insert the member switch in place of the failed command switch, and duplicate its connections to the cluster members.

**Step 3** Start a CLI session on the new command switch.

You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see the switch hardware installation guide.

**Step 4** At the switch prompt, enter privileged EXEC mode:

```
Switch> enable
Switch#
```

**Step 5** Enter the password of the **failed command switch**.

**Step 6** Enter global configuration mode.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

**Step 7** Remove the member switch from the cluster.

```
Switch(config)# no cluster commander-address
```
Step 8 Return to privileged EXEC mode.
Switch(config)# end
Switch#

Step 9 Use the manufacturing default configuration, or set up the switch through the management module.

Step 10 Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter setup, and press Return.
Switch# setup
--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y

At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '{}'.

Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system

Would you like to enter basic management setup? [yes/no]:

Step 11 Enter Y at the first prompt.
The prompts in the setup program vary depending on the member switch that you selected to be the command switch:
Continue with configuration dialog? [yes/no]: y
or
Configuring global parameters:

If this prompt does not appear, enter enable, and press Return. Enter setup, and press Return to start the setup program.

Step 12 Respond to the questions in the setup program.
When prompted for the host name, recall that on a command switch, the host name is limited to 28 characters; on a member switch to 31 characters. Do not use -n, where n is a number, as the last character in a host name for any switch.
When prompted for the Telnet (virtual terminal) password, recall that it can be from 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

Step 13 When prompted for the enable secret and enable passwords, enter the passwords of the failed command switch again.

Step 14 When prompted, make sure to enable the switch as the cluster command switch, and press Return.

Step 15 When prompted, assign a name to the cluster, and press Return.
The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

Step 16 After the initial configuration appears, verify that the addresses are correct.

Step 17 If the displayed information is correct, enter Y, and press Return.
If this information is not correct, enter N, press Return, and begin again at Step 9.

Step 18 Start your browser, and enter the IP address of the new command switch.

Step 19 From the Cluster menu, select Add to Cluster to display a list of candidate switches to add to the cluster.
Replacing a Failed Command Switch with Another Switch

To replace a failed command switch with a switch that is command-capable but not part of the cluster, follow these steps:

**Step 1** Disconnect the command switch from the member switches, and physically remove it from the cluster.

**Step 2** Insert the new switch in place of the failed command switch, and duplicate its connections to the cluster members.

**Step 3** Start a CLI session on the new command switch.

You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see the switch hardware installation guide.

**Step 4** At the switch prompt, enter privileged EXEC mode:

```
Switch> enable
Switch#
```

**Step 5** Enter the password of the **failed command switch**.

**Step 6** Use the manufacturing default configuration, or set up the switch through the management module.

**Step 7** Use the setup program to configure the switch IP information.

This program prompts you for IP address information and passwords. From privileged EXEC mode, enter `setup`, and press **Return**.

```
Switch# setup
--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y
```

At any point you may enter a question mark '?' for help. Use `ctrl-c` to abort configuration dialog at any prompt. Default settings are in square brackets '[]'.

Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system.

Would you like to enter basic management setup? [yes/no]:

**Step 8** Enter **Y** at the first prompt.

The prompts in the setup program vary depending on the switch you selected to be the command switch:

```
Continue with configuration dialog? [yes/no]: y
```

or

```
Configuring global parameters:
```

If this prompt does not appear, enter `enable`, and press **Return**. Enter `setup`, and press **Return** to start the setup program.

**Step 9** Respond to the questions in the setup program.

When prompted for the host name, recall that on a command switch, the host name is limited to 28 characters. Do not use `-n`, where `n` is a number, as the last character in a host name for any switch.

When prompted for the Telnet (virtual terminal) password, recall that it can be from 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.
**Preventing Autonegotiation Mismatches**

The IEEE 802.3ab autonegotiation protocol manages the switch settings for speed (10 Mbps, 100 Mbps, and 1000 Mbps excluding GBIC ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.
- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize switch performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

- Let both ports autonegotiate both speed and duplex.
- Manually set the speed and duplex parameters for the ports on both ends of the connection.

**Recovering from Lost Member Connectivity**

Some configurations can prevent the command switch from maintaining contact with member switches. If you are unable to maintain management contact with a member, and the member switch is forwarding packets normally, check for these conflicts:

- A member switch (Cisco Systems Intelligent Gigabit Ethernet Switch Module, Catalyst 3550, 3500 XL, 2955, 2950, 2940, 2900 XL, 2820, and 1900) cannot connect to the command switch through a port that is defined as a network port.
- Catalyst 3500 XL, Catalyst 2900 XL, Catalyst 2820, and Catalyst 1900 member switches must connect to the command switch through a port that belongs to the same management VLAN.
- A member switch (Cisco Systems Intelligent Gigabit Ethernet Switch Module, Catalyst 3550, Catalyst 3500 XL, Catalyst 2950, Catalyst 2940, Catalyst 2900 XL, Catalyst 2820, and Catalyst 1900) connected to the command switch through a secured port can lose connectivity if the port is disabled because of a security violation.

---

**Step 10**  When prompted for the **enable secret** and **enable** passwords, enter the passwords of the **failed command switch** again.

**Step 11**  When prompted, make sure to enable the switch as the cluster command switch, and press **Return**.

**Step 12**  When prompted, assign a name to the cluster, and press **Return**.

The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

**Step 13**  When the initial configuration displays, verify that the addresses are correct.

**Step 14**  If the displayed information is correct, enter **Y**, and press **Return**.

If this information is not correct, enter **N**, press **Return**, and begin again at Step 9.

**Step 15**  Start your browser, and enter the IP address of the new command switch.

**Step 16**  From the Cluster menu, select **Add to Cluster** to display a list of candidate switches to add to the cluster.
GBIC and SFP Module Security and Identification

Cisco Course Wave Division Multiplexer (CWDM) Gigabit Interface Converter (GBIC) and small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an CWDM GBIC or SFP module is inserted in the switch, the switch software reads the EEPROM to check the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the switch places the interface in an error-disabled state.

If you are using a non-Cisco CWDM GBIC or SFP module, remove the GBIC or SFP module from the switch, and replace it with a Cisco module.

After inserting a Cisco or module, use the `errdisable recovery cause gbic-invalid` global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the switch brings the interface out of the error-disabled state and retries the operation. For more information about the `errdisable recovery` command, see the command reference for this release.

Diagnosing Connectivity Problems

This section describes how to troubleshoot connectivity problems:

- Using Ping, page 31-14
- Using Layer 2 Traceroute, page 31-16

Using Ping

This section consists of this information:

- Understanding Ping, page 31-14
- Executing Ping, page 31-15

Understanding Ping

The switch supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:

- Normal response—The normal response *(hostname* is alive) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a *no-answer* message is returned.
- Unknown host—If the host does not exist, an *unknown host* message is returned.

Note

If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.
- Destination unreachable—If the default gateway cannot reach the specified network, a destination-unreachable message is returned.
- Network or host unreachable—If there is no entry in the route table for the host or network, a network or host unreachable message is returned.

### Executing Ping

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network. Beginning in privileged EXEC mode, use this command to ping another device on the network from the switch:

```
Command                  Purpose
ping [ip] {host | address} Ping a remote host through IP or by supplying the host name or network address.
```

**Note**

Though other protocol keywords are available with the `ping` command, they are not supported in this release.

This example shows how to ping an IP host:

```
Switch# ping 172.20.52.3
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.20.52.3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
Switch#
```

Table 31-1 describes the possible ping character output.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Each exclamation point means receipt of a reply.</td>
</tr>
<tr>
<td>.</td>
<td>Each period means the network server timed out while waiting for a reply.</td>
</tr>
<tr>
<td>U</td>
<td>A destination unreachable error PDU was received.</td>
</tr>
<tr>
<td>C</td>
<td>A congestion experienced packet was received.</td>
</tr>
<tr>
<td>I</td>
<td>User interrupted test.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>&amp;</td>
<td>Packet lifetime exceeded.</td>
</tr>
</tbody>
</table>

To end a ping session, enter the escape sequence (`Ctrl-^X` by default). You enter the default by simultaneously pressing and releasing the `Ctrl`, `Shift`, and `6` keys, and then pressing the `X` key.
Diagnosing Connectivity Problems

Chapter 31  Troubleshooting

Using Layer 2 Traceroute

This section describes this information:

- Understanding Layer 2 Traceroute, page 31-16
- Usage Guidelines, page 31-16
- Displaying the Physical Path, page 31-17

Understanding Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. It determines the path by using the MAC address tables of the switches in the path. When the switch detects a device in the path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

The switch can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

Usage Guidelines

These are the Layer 2 traceroute usage guidelines:

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to functional properly, do not disable CDP. If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

  **Note** For more information about enabling CDP, see Chapter 23, “Configuring CDP.”

- A switch is reachable from another switch when you can test connectivity by using the **ping** privileged EXEC command. All switches in the physical path must be reachable from each other.

- The maximum number of hops identified in the path is ten.

- You can enter the **traceroute mac** or the **traceroute mac ip** privileged EXEC command on a switch that is not in the physical path from the source device to the destination device. All switches in the path must be reachable from this switch.

- The **traceroute mac** command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

- If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.

- If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

- The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the switch uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.
– If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.

– If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.

• When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

• This feature is not supported in Token Ring VLANs.

Displaying the Physical Path

You can display physical path that a packet takes from a source device to a destination device by using one of these privileged EXEC commands:

- `traceroute mac [interface interface-id] {source-mac-address} [interface interface-id] {destination-mac-address} [vlan vlan-id] [detail]`
- `traceroute mac ip {source-ip-address | source-hostname} {destination-ip-address | destination-hostname} [detail]`

For more information, see the command reference for this release.

Diagnosing LRE Connection Problems

Table 31-2 lists problems that you might encounter when configuring and monitoring the LRE ports on the Catalyst 2950 LRE switches. For more information about LRE connections, see the “Environmental Guidelines for LRE Links” section on page 12-9.

For switch upgrade and customer premises equipment (CPE) device upgrade troubleshooting information, see the “Upgrading LRE Switch Firmware” section on page 12-23.

Table 31-2 LRE Port Problems

<table>
<thead>
<tr>
<th>Problem</th>
<th>Suspected Cause and Suggested Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amber LRE port LED</td>
<td>The switch and CPE device are unable to establish an LRE link using the selected profile.</td>
</tr>
<tr>
<td></td>
<td>• Change to a profile with a lower data rate (for example, use LRE-5 instead of LRE-15).</td>
</tr>
<tr>
<td></td>
<td>• Reduce the effect of stubs or bridge taps by terminating them with 300-ohm microfilters.</td>
</tr>
<tr>
<td>Excessive CRC errors on an LRE</td>
<td>A noisy environment (such as motors and power surges) is causing interference with the LRE link.</td>
</tr>
<tr>

</tbody>
</table>
Using Debug Commands

This section explains how you use the **debug** commands to diagnose and resolve internetworking problems. It contains this information:

- Enabling Debugging on a Specific Feature, page 31-19
- Enabling All-System Diagnostics, page 31-19
- Redirecting Debug and Error Message Output, page 31-20
- Using the debug auto qos Command, page 31-20

<table>
<thead>
<tr>
<th>Problem</th>
<th>Suspected Cause and Suggested Solution</th>
</tr>
</thead>
</table>
| High Reed-Solomon error count without CRC errors | - The interleave feature is helping Reed-Solomon error correction to function correctly in a noisy environment. This situation means that the system is on the verge of generating CRC errors.  
  - Change to a profile that has the interleave feature enabled, such as the LRE-5, LRE-10, LRE-15, LRE-10-1, LRE-10-3, or LRE-10-5 profile.  
  - Change the interleave block size value to any value other than 0.  
  - Change to a profile with a lower data rate (for example, use LRE-5 instead of LRE-15) to increase the noise margin.  
  - The LRE link length and quality are close to the limit of operation.  
  - Change to a profile with a lower data rate (for example, use LRE-5 instead of LRE-15).  
  - Reduce the effect of stubs or bridge taps by terminating them with 300-ohm microfilters. |
| Ethernet performance degradation due to excessive network latency | The interleave feature introduces extra latency to increase noise margin.  
  - Adjust upper-layer network protocols to allow for high latency.  
  - Change to a profile with a higher data rate to increase link bandwidth. This decreases the noise margin.  
  - Choose a lower interleave block size value.  
  - Select a low-latency (LL) LRE profile, such as LRE-5LL, LRE-10LL, or LRE-15LL.  
  - Use the LL private profiles with care. The LL profiles have the LL feature enabled and the interleave feature turned off. The LL feature does not delay data transmission, but it makes data more susceptible to interruptions on the LRE link.  
  - All other profiles, public and private, have the interleave feature enabled and the LL feature disabled. The interleave feature provides maximum protection against small interruptions on the LRE link but delays data transmission. For more information about the LRE profiles, see the “LRE Links and LRE Profiles” section on page 12-2. |
| LRE link quality reduced in installations with bundled cables | Cross-talk between the LRE links is causing all links to degrade. Disable unused LRE ports by using the **lre shutdown** interface configuration command. |
Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use `debug` commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use `debug` commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased `debug` command processing overhead will affect system use.

**Caution**

For complete syntax and usage information for specific `debug` commands, see the command reference for this release.

**Enabling Debugging on a Specific Feature**

All `debug` commands are entered in privileged EXEC mode, and most `debug` commands take no arguments. For example, beginning in privileged EXEC mode, enter this command to enable the debugging for EtherChannel:

```
Switch# debug etherchannel
```

The switch continues to generate output until you enter the `no` form of the command.

If you enable a `debug` command and no output appears, consider these possibilities:

- The switch might not be properly configured to generate the type of traffic that you want to monitor. Use the `show running-config` command to verify the configuration.
- Even if the switch is properly configured, it might not generate the type of traffic that you want to monitor during the particular period that debugging is enabled. Depending on the feature you are debugging, you can use commands such as the TCP/IP `ping` command to generate network traffic.

To disable debugging of EtherChannel, enter this command in privileged EXEC mode:

```
Switch# no debug etherchannel
```

Alternately, in privileged EXEC mode, you can enter the `undebug` form of the command:

```
Switch# undebug etherchannel
```

To display the state of each debugging option, enter this command in privileged EXEC mode:

```
Switch# show debugging
```

**Enabling All-System Diagnostics**

Beginning in privileged EXEC mode, enter this command to enable all-system diagnostics:

```
Switch# debug all
```

**Caution**

Because debugging output takes priority over other network traffic, and because the `debug all` privileged EXEC command generates more output than any other `debug` command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific `debug` commands.
The `no debug all` privileged EXEC command disables all diagnostic output. Using the `no debug all` command is a convenient way to ensure that you have not accidentally left any `debug` commands enabled.

## Redirecting Debug and Error Message Output

By default, the network server sends the output from `debug` commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

**Note** Be aware that the debugging destination you use affects system overhead. Logging messages to the console produces very high overhead, whereas logging messages to a virtual terminal produces less overhead. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

For more information about system message logging, see Chapter 26, “Configuring System Message Logging.”

## Using the `debug auto qos` Command

You can use the `debug auto qos` privileged EXEC command to display quality of service (QoS) commands that are automatically generated when automatic-QoS (auto-QoS) is enabled.

Beginning in privileged EXEC mode, follow these steps to display the QoS commands and enable auto-QoS for voice over IP (VoIP) within a QoS domain:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>debug auto qos</code></td>
<td>Enable debugging for auto-QoS. When debugging is enabled, the switch displays the QoS commands that are automatically generated when auto-QoS is enabled or disabled.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>interface interface-id</code></td>
<td>Specify the interface that is connected to a Cisco IP Phone, and enter interface configuration mode. You also can specify the uplink interface that is connected to another switch or router in the interior of the network.</td>
</tr>
<tr>
<td><strong>Step 4</strong> `auto qos voip {cisco-phone</td>
<td>trust}`</td>
</tr>
</tbody>
</table>

- **cisco-phone**—If the interface is connected to a Cisco IP Phone, the QoS labels of incoming packets are trusted only when the Cisco IP phone is detected.
- **trust**—The uplink interface is connected to a trusted switch or router, and the VoIP classification in the ingress packet is trusted.
Using the show controllers Commands

You can display the statistics, configuration, and other information about the Catalyst 2950 LRE switch, the connected CPE devices, and the LRE link. Use the privileged EXEC commands in Table 31-3 to display this information:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>show auto qos interface interface-id</td>
<td>Verify your entries. This command displays the auto-QoS configuration that was initially applied; it does not display any user changes to the configuration that might be in effect.</td>
</tr>
</tbody>
</table>

For more information about auto-QoS, see the “Configuring Auto-QoS” section on page 29-9.

This example shows how to display the QoS commands that are automatically generated when auto-QoS is enabled:

```
Switch# debug auto qos
AutoQoS debugging is on
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet0/17
Switch(config-if)# auto qos voip cisco-phone
```

### Using the show controllers Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show controllers ethernet-controller interface-id [asic</td>
<td>ece [port port-id]</td>
</tr>
<tr>
<td>show controllers lre cpe [identity</td>
<td>mfg</td>
</tr>
<tr>
<td>show controllers lre</td>
<td>Displays information about the LRE link.</td>
</tr>
<tr>
<td>show controllers lre log</td>
<td>Displays the history of the link, configuration, and timer events for a specific LRE interface or for all the LRE switch interfaces.</td>
</tr>
</tbody>
</table>

For more information about the fields in the command output, refer to the switch command reference for this release.

### Using the crashinfo File

This feature is available if your switch is running Cisco IOS Release 12.1(11)EA1 or later.

The crashinfo file saves information that helps Cisco technical support representatives to debug problems that caused the software image to fail (crash). The switch writes the crash information to the console at the time of the failure, and the file is created the next time you boot the image after the failure (instead of while the system is failing).
The information in the file includes the software image name and version that failed, a dump of the processor registers, and a stack trace. You can give this information to the technical support representative by using the `show tech-support` privileged EXEC command.

All crashinfo files are kept in this directory on the flash file system:

flash:/crashinfo/crashinfo_n where n is a sequence number.

Each new crashinfo file that is created uses a sequence number that is larger than any previously existing sequence number, so the file with the largest sequence number describes the most recent failure. Version numbers are used instead of a timestamp because the switches do not include a real-time clock. You cannot change the name of the file that the system will use when it creates the file. However, after the file is created, you can use the `rename` privileged EXEC command to rename it, but the contents of the renamed file will not be displayed by the `show stacks` or the `show tech-support` privileged EXEC command. You can delete crashinfo files by using the `delete` privileged EXEC command.

You can display the most recent crashinfo file (that is, the file with the highest sequence number at the end of its filename) by entering the `show stacks` or the `show tech-support` privileged EXEC command. You also can access the file by using any command that can copy or display files, such as the `more` or the `copy` privileged EXEC command.
Supported MIBs

This appendix lists the supported MIBs for this release. It contains these sections:

- MIB List, page A-1
- Using FTP to Access the MIB Files, page A-3

MIB List

The Catalyst 2955 switch supports the ENTITY-MIB, CISCO-ENVMON-MIB and CISCO-ENTITY-ALARM-MIB.

- BRIDGE-MIB (RFC1493)
- CISCO-2900-MIB
- CISCO-BULK-FILE-MIB
- CISCO-CDP-MIB
- CISCO-CLUSTER-MIB
- CISCO_CONFIG_COPY_MIB
- CISCO-CONFIG-MAN-MIB
- CISCO-ENTITY-MIB
- CISCO-ENTITY-ALARM-MIB (Catalyst 2955 only)
- CISCO-ENTITY-VENDORTYPE-OID-MIB
- CISCO_ENVMON_MIB
- CISCO-FLASH-MIB
- CISCO-FTP-CLIENT-MIB
- CISCO-IETF-VDSL-LINE-MIB (Catalyst 2950 Long-Reach Ethernet [LRE] only)
- CISCO-IGMP-FILTER-MIB
- CISCO-IMAGE-MIB
- CISCO-LRE-CPR-MIB (Catalyst 2950 LRE only)
- CISCO-MAC-NOTIFICATION-MIB
- CISCO-MEMORY-POOL-MIB
MIB List

- CISCO-PAE-MIB
- CISCO-PAGP-MIB
- CISCO-PING-MIB
- CISCO-PORT-SECURITY-MIB
- CISCO-PROCESS-MIB
- CISCO-PRODUCTS-MIB
- CISCO-RTTMON-MIB (subsystems supported: sub_rtt_rmon and sub_rtt_rmonlib)
- CISCO-SMI
- CISCO_STACKMAKER_MIB
- CISCO-STP-EXTENSIONS-MIB
- CISCO-SYSLOG-MIB
- CISCO-TC
- CISCO-TCP-MIB
- CISCO-VLAN-MEMBERSHIP-MIB
- CISCO-VTP-MIB
- ENTITY-MIB
- IEEE8021-PAE-MIB
- IANAifType-MIB
- IF-MIB (RFC 1573)
- OLD-CISCO-CHASSIS-MIB
- OLD-CISCO-CPU-MIB
- OLD-CISCO-INTERFACES-MIB
- OLD-CISCO-IP-MIB
- OLD-CISCO-Memory-MIB
- OLD-CISCO-SYSTEM-MIB
- OLD-CISCO-TCP-MIB
- OLD-CISCO-TS-MIB
- RFC1213-MIB
- RMON-MIB (RFC 1757)
- RFC1398-MIB
- RS-232-MIB
- SNMPv2-MIB
- SNMPv2-SMI
- SNMPv2-TC
- TCP-MIB
- UDP-MIB
Using FTP to Access the MIB Files

You can get each MIB file by using this procedure:

Step 1 Make sure that your FTP client is in passive mode.

Note Some FTP clients do not support passive mode.

Step 2 Use FTP to access the server ftp.cisco.com.

Step 3 Log in with the username anonymous.

Step 4 Enter your e-mail username when prompted for the password.

Step 5 At the ftp> prompt, change directories to /pub/mibs/v1 and the /pub/mibs/v2.

Step 6 Use the get MIB_filename command to obtain a copy of the MIB file.

You can also access information about MIBs on the Cisco website:

The IF-MIB and the CISCO-IETF-VDSL-LINE-MIB are supported as read-only MIBs for the Fast Ethernet interfaces on the CPE devices.
Working with the Cisco IOS File System, Configuration Files, and Software Images

This appendix describes how to manipulate the 2950 or 2955 flash file system, how to copy configuration files, and how to archive (upload and download) software images.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the Cisco IOS Configuration Fundamentals Command Reference.

This appendix consists of these sections:
- Working with the Flash File System, page B-1
- Working with Configuration Files, page B-7
- Working with Software Images, page B-18

Working with the Flash File System

The flash file system on your switch provides several commands to help you manage software image and configuration files.

The flash file system is a single flash device on which you can store files. This flash device is called flash:

This section contains this information:
- Displaying Available File Systems, page B-2
- Setting the Default File System, page B-3
- Displaying Information about Files on a File System, page B-3
- Creating and Removing Directories, page B-4
- Copying Files, page B-4
- Deleting Files, page B-5
- Creating, Displaying, and Extracting tar Files, page B-5
- Displaying the Contents of a File, page B-7
Displaying Available File Systems

To display the available file systems on your switch, use the `show file systems` privileged EXEC command as shown in this example:

```
Switch# show file systems
File Systems:

<table>
<thead>
<tr>
<th>Size(b)</th>
<th>Free(b)</th>
<th>Type</th>
<th>Flags</th>
<th>Prefixes</th>
</tr>
</thead>
<tbody>
<tr>
<td>* 16128000</td>
<td>11118592</td>
<td>flash</td>
<td>rw</td>
<td>flash:</td>
</tr>
<tr>
<td>16128000</td>
<td>11118592</td>
<td>unknown</td>
<td>rw</td>
<td>zflash:</td>
</tr>
<tr>
<td>32768</td>
<td>26363</td>
<td>nvram</td>
<td>rw</td>
<td>nvram:</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>network</td>
<td>rw</td>
<td>tftp:</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>opaque</td>
<td>rw</td>
<td>null:</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>opaque</td>
<td>rw</td>
<td>system:</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>opaque</td>
<td>ro</td>
<td>xmodem:</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>opaque</td>
<td>ro</td>
<td>ymodem:</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>network</td>
<td>rw</td>
<td>rcp:</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>network</td>
<td>rw</td>
<td>ftp:</td>
</tr>
</tbody>
</table>
```

Table B-1 show file systems Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size(b)</td>
<td>Amount of memory in the file system in bytes.</td>
</tr>
<tr>
<td>Free(b)</td>
<td>Amount of free memory in the file system in bytes.</td>
</tr>
</tbody>
</table>
| Type | Type of file system.  
  flash—The file system is for a flash memory device.  
  nvram—The file system is for an NVRAM device.  
  opaque—The file system is a locally generated pseudo file system (for example, the system) or a download interface, such as brimux.  
  unknown—The file system is an unknown type. |
| Flags | Permission for file system.  
  ro—read-only.  
  rw—read/write.  
  wo—write-only. |
| Prefixes | Alias for file system.  
  flash:—Flash file system.  
  nvram:—NVRAM.  
  null:—Null destination for copies. You can copy a remote file to null to determine its size.  
  rcp:—Remote Copy Protocol (RCP) network server.  
  system:—Contains the system memory, including the running configuration.  
  tftp:—TFTP network server.  
  xmodem:—Obtain the file from a network machine by using the Xmodem protocol.  
  ymodem:—Obtain the file from a network machine by using the Ymodem protocol.  
  zflash:—Read-only file decompression file system, which mirrors the contents of the flash file system. |
Setting the Default File System

You can specify the file system or directory that the system uses as the default file system by using the `cd filesystem:` privileged EXEC command. You can set the default file system to omit the `filesystem:` argument from related commands. For example, for all privileged EXEC commands that have the optional `filesystem:` argument, the system uses the file system specified by the `cd` command.

By default, the default file system is `flash:`.

You can display the current default file system as specified by the `cd` command by using the `pwd` privileged EXEC command.

Displaying Information about Files on a File System

You can view a list of the contents of a file system before manipulating its contents. For example, before copying a new configuration file to flash memory, you might want to verify that the file system does not already contain a configuration file with the same name. Similarly, before copying a flash configuration file to another location, you might want to verify its filename for use in another command.

To display information about files on a file system, use one of the privileged EXEC commands in Table B-2:

### Displaying Information about Files on a File System

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dir [filesystem:] [filename]</code></td>
<td>Display a list of files on a file system.</td>
</tr>
<tr>
<td><code>show file systems</code></td>
<td>Display more information about each of the files on a file system.</td>
</tr>
<tr>
<td><code>show file information file-url</code></td>
<td>Display information about a specific file.</td>
</tr>
<tr>
<td><code>show file descriptors</code></td>
<td>Display a list of open file descriptors. File descriptors are the internal representations of open files. You can use this command to see if another user has a file open.</td>
</tr>
</tbody>
</table>

### Changing Directories and Displaying the Working Directory

Beginning in privileged EXEC mode, follow these steps to change directories and display the working directory.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>dir filesystem:</code></td>
<td>Display the directories on the specified file system. For <code>filesystem:</code>, use <code>flash:</code> for the system board flash device.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>cd new_configs</code></td>
<td>Change to the directory of interest. The command example shows how to change to the directory named <code>new_configs</code>.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>pwd</code></td>
<td>Display the working directory.</td>
</tr>
</tbody>
</table>
## Creating and Removing Directories

Beginning in privileged EXEC mode, follow these steps to create and remove a directory:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 dir filesystem:</td>
<td>Display the directories on the specified file system.</td>
</tr>
<tr>
<td></td>
<td>For filesystem:, use flash: for the system board flash device.</td>
</tr>
<tr>
<td>Step 2 mkdir old_configs</td>
<td>Create a new directory.</td>
</tr>
<tr>
<td></td>
<td>The command example shows how to create the directory named old_configs.</td>
</tr>
<tr>
<td></td>
<td>Directory names are case sensitive.</td>
</tr>
<tr>
<td></td>
<td>Directory names are limited to 45 characters between the slashes (/);</td>
</tr>
<tr>
<td></td>
<td>the name cannot contain control characters, spaces, deletes, slashes,</td>
</tr>
<tr>
<td></td>
<td>quotes, semicolons, or colons.</td>
</tr>
<tr>
<td>Step 3 dir filesystem:</td>
<td>Verify your entry.</td>
</tr>
</tbody>
</table>

To delete a directory with all its files and subdirectories, use the `delete /force /recursive filesystem:/file-url` privileged EXEC command.

Use the `/recursive` keyword to delete the named directory and all subdirectories and the files contained in it. Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the `/force` and `/recursive` keywords for deleting old software images that were installed by using the `archive download-sw` command but are no longer needed.

For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the name of the directory to be deleted. All the files in the directory and the directory are removed.

**Caution**

When files and directories are deleted, their contents cannot be recovered.

## Copying Files

To copy a file from a source to a destination, use the `copy [/erase] source-url destination-url` privileged EXEC command. For the source and destination URLs, you can use `running-config` and `startup-config` keyword shortcuts. For example, the `copy running-config startup-config` command saves the currently running configuration file to the NVRAM section of flash memory to be used as the configuration during system initialization.

You can also copy to and from special file systems (`xmodem:`, `ymodem:`) as the source or destination for the file from a network machine that uses the Xmodem or Ymodem protocol.

Network file system URLs include `ftp:`, `rcp:`, and `tftp:` and have these syntaxes:

- **FTP**—`ftp:][/username [:password]@location]/directory[/filename`
- **Remote Copy Protocol (RCP)**—`rcp:][/username@location]/directory[/filename`
- **TFTP**—`tftp:][/location]/directory[/filename`
Local writable file systems include flash:.

Some invalid combinations of source and destination exist. Specifically, you cannot copy these combinations:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the copy flash: flash: command is invalid)

For specific examples of using the copy command with configuration files, see the “Working with Configuration Files” section on page B-7.

To copy software images either by downloading a new version or uploading the existing one, use the archive download-sw or the archive upload-sw privileged EXEC command. For more information, see the “Working with Software Images” section on page B-18.

Deleting Files

When you no longer need a file on a flash memory device, you can permanently delete it. To delete a file or directory from a specified flash device, use the delete [/force] [/recursive] [filesystem:]file-url privileged EXEC command.

Use the /recursive keyword for deleting a directory and all subdirectories and the files contained in it. Use the /force keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the /force and /recursive keywords for deleting old software images that were installed by using the archive download-sw command but are no longer needed.

If you omit the filesystem: option, the switch uses the default device specified by the cd command. For file-url, you specify the path (directory) and the name of the file to be deleted.

If you attempt to delete the file specified by the CONFIG_FILE or BOOT environment variable, the system prompts you to confirm the deletion. If you attempt to delete the last valid system image specified in the BOOT environment variable, the system prompts you to confirm the deletion.

Caution

When files are deleted, their contents cannot be recovered.

This example shows how to delete the file myconfig from the default flash memory device:

Switch# delete myconfig

Creating, Displaying, and Extracting tar Files

You can create a tar file and write files into it, list the files in a tar file, and extract the files from a tar file as described in the next sections.

Creating a tar File

To create a tar file and write files into it, use the privileged EXEC command:

archive tar /create destination-url flash:/file-url
For destination-url, specify the destination URL alias for the local or network file system and the name of the tar file to create. These options are supported:

- For the local flash file system, the syntax is `flash:`
- For the FTP, the syntax is `ftp:////username[:password]@location][directory]/tar-filename.tar`
- For the RCP, the syntax is `rcp:////username@location][directory]/tar-filename.tar`
- For the TFTP, the syntax is `tftp:////location][directory]/tar-filename.tar`

The `tar-filename.tar` is the tar file to be created.

For flash:/file-url, specify the location on the local flash file system from which the new tar file is created. You can also specify an optional list of files or directories within the source directory to write to the new tar file. If none are specified, all files and directories at this level are written to the newly created tar file.

This example shows how to create a tar file. This command writes the contents of the `new-configs` directory on the local flash device to a file named `saved.tar` on the TFTP server at 172.20.10.30:

```
Switch# archive tar /create tftp:172.20.10.30/saved.tar flash:/new-configs
```

### Displaying the Contents of a tar File

To display the contents of a tar file on the screen, use this privileged EXEC command:

```
archive tar /table source-url
```

For source-url, specify the source URL alias for the local or network file system. These options are supported:

- For the local flash file system, the syntax is `flash:`
- For the FTP, the syntax is `ftp:////username[:password]@location][directory]/tar-filename.tar`
- For the RCP, the syntax is `rcp:////username@location][directory]/tar-filename.tar`
- For the TFTP, the syntax is `tftp:////location][directory]/tar-filename.tar`

The `tar-filename.tar` is the tar file to display.

You can also limit the display of the files by specifying an optional list of files or directories after the tar file; then only these files are displayed. If none are specified, all files and directories are displayed.

This example shows how to display the contents of the `c2950lre-i612q4-mz.121-21.EA1.tar` file that is in Flash memory:

```
Switch# archive tar /table flash:c2950lre-i612q4-mz.121-21.EA1.tar
info (219 bytes)
c2950lre-i612q4-mz.121-21.EA1/ (directory)
c2950lre-i612q4-mz.121-21.EA1/html/ (directory)
c2950lre-i612q4-mz.121-21.EA1/html/foo.html (0 bytes)
c2950lre-i612q4-mz.121-21.EA1/c2950lre-i612q4-mz.121-21.EA1.bin (610856 bytes)
c2950lre-i612q4-mz.121-21.EA1/info (219 bytes)
info.ver (219 bytes)
```

This example shows how to display only the `c2950lre-i612q4-mz.121-21.EA1/html` directory and its contents:

```
Switch# archive tar /table flash:c2950lre-i612q4-mz.121-21.EA1/html
```

```
c2950lre-i612q4-mz.121-21.EA1/html/ (directory)
c2950lre-i612q4-mz.121-21.EA1/html/foo.html (0 bytes)
```
Extracting a tar File

To extract a tar file into a directory on the flash file system, use the privileged EXEC command:

```
archive tar /xtract source-url flash://file-url [dir/file...]
```

For `source-url`, specify the source URL alias for the local file system. These options are supported:

- For the local flash file system, the syntax is `flash://`.
- For the FTP, the syntax is `ftp://[[username[:password]@location]/directory]/tar-filename.tar`
- For the RCP, the syntax is `rcp://[[username@location]/directory]/tar-filename.tar`
- For the TFTP, the syntax is `tftp://[[location]/directory]/tar-filename.tar`

The `tar-filename.tar` is the tar file from which to extract files.

For `flash://file-url [dir/file...]`, specify the location on the local flash file system into which the tar file is extracted. Use the `dir/file...` option to specify an optional list of files or directories within the tar file to be extracted. If none are specified, all files and directories are extracted.

This example shows how to extract the contents of a tar file located on the TFTP server at 172.20.10.30. This command extracts just the `new-configs` directory into the root directory on the local flash file system. The remaining files in the `saved.tar` file are ignored.

```
Switch# archive tar /xtract tftp://172.20.10.30/saved.tar flash:/new-configs
```

Displaying the Contents of a File

To display the contents of any readable file, including a file on a remote file system, use the `more` privileged EXEC command:

```
more [ascii |/binary |/ebcdic] file-url
```

This example shows how to display the contents of a configuration file on a TFTP server:

```
Switch# more tftp://serverA/hampton/savedconfig
! Saved configuration on server
! version 11.3
service timestamps log datetime localtime
service linenumber
service udp-small-servers
service pt-vty-logging
!
<output truncated>
```

Working with Configuration Files

This section describes how to create, load, and maintain configuration files. You can create a basic configuration file by using the `setup` program or by entering the `setup` privileged EXEC command. For more information, see Chapter 4, “Assigning the Switch IP Address and Default Gateway.”

You can copy (download) configuration files from a TFTP, FTP, or RCP server to the running configuration or startup configuration of the switch. You might want to perform this for one of these reasons:

- To restore a backed-up configuration file.
Guidelines for Creating and Using Configuration Files

Creating configuration files can aid in your switch configuration. Configuration files can contain some or all of the commands needed to configure one or more switches. For example, you might want to download the same configuration file to several switches that have the same hardware configuration.

Use these guidelines when creating a configuration file:

- We recommend that you connect through the port when using configuration files to configure the switch. If you configure the switch from a Telnet session, IP addresses are not changed, and ports and modules are not disabled.
- If no passwords have been set on the switch, you must set them on each switch by entering the `enable secret secret-password` global configuration command. Enter a blank line for this command. The password is saved in the configuration file as clear text.
- If passwords already exist, you cannot enter the `enable secret secret-password` global configuration command in the file because the password verification will fail. If you enter a password in the configuration file, the switch mistakenly attempts to execute the passwords as commands as it executes the file.

**Note**

The `copy {ftp | rcp | tftp:} system:running-config` privileged EXEC command loads the configuration files on the switch as if you were entering the commands at the command line. The switch does not erase the existing running configuration before adding the commands. If a command in the copied configuration file replaces a command in the existing configuration file, the existing command is erased. For example, if the copied configuration file contains a different IP address in a particular command than the existing configuration, the IP address in the copied configuration is used. However, some commands in the existing configuration might not be replaced or negated. In this case, the resulting
configuration file is a mixture of the existing configuration file and the copied configuration file, with the copied configuration file having precedence.

To restore a configuration file to an exact copy of a file stored on a server, copy the configuration file directly to the startup configuration (by using the `copy {ftp: | rcp: | tftp:} nvram:startup-config` privileged EXEC command), and reload the switch.

**Configuration File Types and Location**

Startup configuration files are used during system startup to configure the software. Running configuration files contain the current configuration of the software. The two configuration files can be different. For example, you might want to change the configuration for a short time period rather than permanently. In this case, you would change the running configuration but not save the configuration by using the `copy running-config startup-config` privileged EXEC command.

The running configuration is saved in DRAM; the startup configuration is stored in the NVRAM section of flash memory.

**Creating a Configuration File By Using a Text Editor**

When creating a configuration file, you must list commands logically so that the system can respond appropriately. This is one method of creating a configuration file:

**Step 1** Copy an existing configuration from a switch to a server.

For more information, see the “Downloading the Configuration File By Using TFTP” section on page B-10, the “Downloading a Configuration File By Using FTP” section on page B-12, or the “Downloading a Configuration File By Using RCP” section on page B-16.

**Step 2** Open the configuration file in a text editor, such as vi or emacs on UNIX or Notepad on a PC.

**Step 3** Extract the portion of the configuration file with the desired commands, and save it in a new file.

**Step 4** Copy the configuration file to the appropriate server location. For example, copy the file to the TFTP directory on the workstation (usually /tftpboot on a UNIX workstation).

**Step 5** Make sure the permissions on the file are set to world-read.

**Copying Configuration Files By Using TFTP**

You can configure the switch by using configuration files you create, download from another switch, or download from a TFTP server. You can copy (upload) configuration files to a TFTP server for storage.

This section includes this information:

- Preparing to Download or Upload a Configuration File By Using TFTP, page B-10
- Downloading the Configuration File By Using TFTP, page B-10
- Uploading the Configuration File By Using TFTP, page B-11
Prefering to Download or Upload a Configuration File By Using TFTP

Before you begin downloading or uploading a configuration file by using TFTP, do these tasks:

- Ensure that the workstation acting as the TFTP server is properly configured. On a Sun workstation, make sure that the /etc/inetd.conf file contains this line:
  
  tftp dgram udp wait root /usr/etc/in.tftpd in.tftpd -p -s /tftpboot

  Make sure that the /etc/services file contains this line:
  
  tftp 69/udp

  **Note** You must restart the inetd daemon after modifying the /etc/inetd.conf and /etc/services files. To restart the daemon, either stop the inetd process and restart it, or enter a fastboot command (on the SunOS 4.x) or a reboot command (on Solaris 2.x or SunOS 5.x). For more information on the TFTP daemon, see the documentation for your workstation.

- Ensure that the switch has a route to the TFTP server. The switch and the TFTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the TFTP server by using the ping command.

- Ensure that the configuration file to be downloaded is in the correct directory on the TFTP server (usually /tftpboot on a UNIX workstation).

- For download operations, ensure that the permissions on the file are set correctly. The permission on the file should be world-read.

- Before uploading the configuration file, you might need to create an empty file on the TFTP server. To create an empty file, enter the touch filename command, where filename is the name of the file you will use when uploading it to the server.

- During upload operations, if you are overwriting an existing file (including an empty file, if you had to create one) on the server, ensure that the permissions on the file are set correctly. Permissions on the file should be world-write.

Downloading the Configuration File By Using TFTP

To configure the switch by using a configuration file downloaded from a TFTP server, follow these steps:

**Step 1** Copy the configuration file to the appropriate TFTP directory on the workstation.

**Step 2** Verify that the TFTP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using TFTP” section on page B-10.

**Step 3** Log into the switch through a Telnet session.

**Step 4** Download the configuration file from the TFTP server to configure the switch.

Specify the IP address or host name of the TFTP server and the name of the file to download. Use one of these privileged EXEC commands:

- `copy tftp:[[[//location//directory]]/filename] system:running-config`
- `copy tftp:[[[//location//directory]]/filename] nvram:startup-config`

The configuration file downloads, and the commands are executed as the file is parsed line-by-line.
This example shows how to configure the software from the file `tokyo-confg` at IP address 172.16.2.155:

```
Switch# copy tftp://172.16.2.155/tokyo-confg system:running-config
```

```
Configure using tokyo-confg from 172.16.2.155? [confirm] y
Booting tokyo-confg from 172.16.2.155:!!! [OK - 874/16000 bytes]
```

### Uploading the Configuration File By Using TFTP

To upload a configuration file from a switch to a TFTP server for storage, follow these steps:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Verify that the TFTP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using TFTP” section on page B-10.</td>
</tr>
<tr>
<td>2</td>
<td>Log into the switch through a Telnet session.</td>
</tr>
<tr>
<td>3</td>
<td>Upload the switch configuration to the TFTP server. Specify the IP address or host name of the TFTP server and the destination filename. Use one of these privileged EXEC commands:</td>
</tr>
</tbody>
</table>

- `copy system:running-config tftp://[location]/[directory]/[filename]`
- `copy nvram:startup-config tftp://[location]/[directory]/[filename]`

The file is uploaded to the TFTP server.

This example shows how to upload a configuration file from a switch to a TFTP server:

```
Switch# copy system:running-config tftp://172.16.2.155/tokyo-confg
```

```
Write file tokyo-confg on host 172.16.2.155? [confirm] y
# Writing tokyo-confg!!! [OK]
```

### Copying Configuration Files By Using FTP

You can copy configuration files to or from an FTP server.

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy a configuration file from the switch to a server by using FTP, the software sends the first valid username in this list:

- The username specified in the `copy` command if a username is specified.
- The username set by the `ip ftp username` global configuration command if the command is configured.
- Anonymous.

The switch sends the first valid password in this list:

- The password specified in the `copy` command if a password is specified.
- The password set by the `ip ftp password` global configuration command if the command is configured.
- The switch forms a password named `username@switchname.domain`. The variable `username` is the username associated with the current session, `switchname` is the configured host name, and `domain` is the domain of the switch.
The username and password must be associated with an account on the FTP server. If you are writing to
the server, the FTP server must be properly configured to accept your FTP write request.

Use the `ip ftp username` and `ip ftp password` commands to specify a username and password for all
copies. Include the username in the `copy` command if you want to specify only a username for that copy
operation.

If the server has a directory structure, the configuration file is written to or copied from the directory
associated with the username on the server. For example, if the configuration file is in the home directory
of a user on the server, specify that user's name as the remote username.

For more information, see the documentation for your FTP server.

This section includes this information:

- Preparing to Download or Upload a Configuration File By Using FTP, page B-12
- Downloading a Configuration File By Using FTP, page B-12
- Uploading a Configuration File By Using FTP, page B-13

Preparing to Download or Upload a Configuration File By Using FTP

Before you begin downloading or uploading a configuration file by using FTP, do these tasks:

- Ensure that the switch has a route to the FTP server. The switch and the FTP server must be in the
  same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to
  the FTP server by using the `ping` command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid
  username, make sure that the current FTP username is the one that you want to use for the FTP
download. You can enter the `show users` privileged EXEC command to view the valid username. If
  you do not want to use this username, create a new FTP username by using the `ip ftp username
  username` global configuration command during all copy operations. The new username is stored in
  NVRAM. If you are accessing the switch through a Telnet session and you have a valid username,
  this username is used, and you do not need to set the FTP username. Include the username in the
  `copy` command if you want to specify a username for only that copy operation.
- When you upload a configuration file to the FTP server, it must be properly configured to accept the
  write request from the user on the switch.

For more information, see the documentation for your FTP server.

Downloading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to download a configuration file by using FTP:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Verify that the FTP server is properly configured by referring to the</td>
</tr>
<tr>
<td><code>ping</code></td>
<td>“Preparing to Download or Upload a Configuration File By Using FTP”</td>
</tr>
<tr>
<td></td>
<td>section on page B-12.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Log into the switch through a Telnet session.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode on the switch.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>This step is required only if you override the default remote</td>
</tr>
<tr>
<td></td>
<td>username or password (see Steps 4, 5, and 6).</td>
</tr>
</tbody>
</table>
### Working with Configuration Files

This example shows how to copy a configuration file named `host1-confg` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 and to load and run those commands on the switch:

```
Switch# copy ftp://netadmin1:mypass@172.16.101.101/host1-confg system:running-config
Configure using host1-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-confg:![OK]
Switch#
%SYS-5-CONFIG: Configured from host1-config by ftp from 172.16.101.101
```

This example shows how to specify a remote username of `netadmin1`. The software copies the configuration file `host2-confg` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 to the startup configuration.

```
Switch# configure terminal
Switch(config)# ip ftp username netadmin1
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy ftp://netadmin1:mypass@172.16.101.101/host2-confg nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-confg
Configure using host2-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-confg:!![OK]
Switch#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by ftp from 172.16.101.101
```

### Uploading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using FTP:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ip ftp username username</td>
<td>(Optional) Change the default remote username.</td>
</tr>
<tr>
<td>2</td>
<td>ip ftp password password</td>
<td>(Optional) Change the default password.</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>copy ftp://[[//][username]:password]@[location]/directory][filename] system:running-config or copy ftp://[[//][username]:password]@[location]/directory][filename] nvram:startup-config</td>
<td>Using FTP, copy the configuration file from a network server to the running configuration or to the startup configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to copy a configuration file named `host1-confg` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 and to load and run those commands on the switch:

```
Switch# copy ftp://netadmin1:mypass@172.16.101.101/host1-confg system:running-config
Configure using host1-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-confg:![OK]
Switch#
%SYS-5-CONFIG: Configured from host1-config by ftp from 172.16.101.101
```

This example shows how to specify a remote username of `netadmin1`. The software copies the configuration file `host2-confg` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 to the startup configuration.

```
Switch# configure terminal
Switch(config)# ip ftp username netadmin1
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy ftp://netadmin1:mypass@172.16.101.101/host2-confg nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-confg
Configure using host2-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-confg:!![OK]
Switch#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by ftp from 172.16.101.101
```

### Uploading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using FTP:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ip ftp username username</td>
<td>(Optional) Change the default remote username.</td>
</tr>
<tr>
<td>2</td>
<td>ip ftp password password</td>
<td>(Optional) Change the default password.</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>copy ftp://[[//][username]:password]@[location]/directory][filename] system:running-config or copy ftp://[[//][username]:password]@[location]/directory][filename] nvram:startup-config</td>
<td>Using FTP, copy the configuration file from a network server to the running configuration or to the startup configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to copy a configuration file named `host1-confg` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 and to load and run those commands on the switch:

```
Switch# copy ftp://netadmin1:mypass@172.16.101.101/host1-confg system:running-config
Configure using host1-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-confg:![OK]
Switch#
%SYS-5-CONFIG: Configured from host1-config by ftp from 172.16.101.101
```

This example shows how to specify a remote username of `netadmin1`. The software copies the configuration file `host2-confg` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 to the startup configuration.

```
Switch# configure terminal
Switch(config)# ip ftp username netadmin1
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy ftp://netadmin1:mypass@172.16.101.101/host2-confg nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-confg
Configure using host2-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-confg:!![OK]
Switch#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by ftp from 172.16.101.101
```

### Uploading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using FTP:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ip ftp username username</td>
<td>(Optional) Change the default remote username.</td>
</tr>
<tr>
<td>2</td>
<td>ip ftp password password</td>
<td>(Optional) Change the default password.</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>copy ftp://[[//][username]:password]@[location]/directory][filename] system:running-config or copy ftp://[[//][username]:password]@[location]/directory][filename] nvram:startup-config</td>
<td>Using FTP, copy the configuration file from a network server to the running configuration or to the startup configuration file.</td>
</tr>
</tbody>
</table>
## Appendix B  Working with the Cisco IOS File System, Configuration Files, and Software Images

### Working with Configuration Files

This example shows how to copy the running configuration file named `switch2-confg` to the `netadmin1` directory on the remote host with an IP address of 172.16.101.101:

```
Switch# copy system:running-config ftp://netadmin1:mypass@172.16.101.101/switch2-confg
Write file switch2-confg on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Switch#
```

This example shows how to store a startup configuration file on a server by using FTP to copy the file:

```
Switch# configure terminal
Switch(config)# ip ftp username netadmin2
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy nvram:startup-config ftp://netadmin1:mypass@172.16.101.101/switch2-confg
Remote host[]? 172.16.101.101
Name of configuration file to write [switch2-confg]?
Write file switch2-confg on host 172.16.101.101?[confirm]
! [OK]
```

### Copying Configuration Files By Using RCP

The RCP provides another method of downloading, uploading, and copying configuration files between remote hosts and the switch. Unlike TFTP, which uses User Datagram Protocol (UDP), a connectionless protocol, RCP uses TCP, which is connection-oriented.

To use RCP to copy files, the server from or to which you will be copying files must support RCP. The RCP copy commands rely on the rsh server (or daemon) on the remote system. To copy files by using RCP, you do not need to create a server for file distribution as you do with TFTP. You only need to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, RCP creates it for you.

The RCP requires a client to send a remote username with each RCP request to a server. When you copy a configuration file from the switch to a server, the software sends the first valid username in this list:

- The username specified in the `copy` command if a username is specified.

### Command Summary

- **Step 3**  
  **command**: `configure terminal`  
  **Purpose**: Enter global configuration mode.
  
  This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).

- **Step 4**  
  **command**: `ip ftp username username`  
  **Purpose**: (Optional) Change the default remote username.

- **Step 5**  
  **command**: `ip ftp password password`  
  **Purpose**: (Optional) Change the default password.

- **Step 6**  
  **command**: `end`  
  **Purpose**: Return to privileged EXEC mode.

- **Step 7**  
  **command**: `copy system:running-config ftp://username:password@location/directory/filename`  
  or  
  `copy nvram:startup-config ftp://username:password@location/directory/filename`  
  **Purpose**: Using FTP, store the switch running or startup configuration file to the specified location.
• The username set by the `ip rcmd remote-username username` global configuration command if the command is configured.

• The remote username associated with the current TTY (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the `username` command, the switch software sends the Telnet username as the remote username.

• The switch host name.

For a successful RCP copy request, you must define an account on the network server for the remote username. If the server has a directory structure, the configuration file is written to or copied from the directory associated with the remote username on the server. For example, if the configuration file is in the home directory of a user on the server, specify that user's name as the remote username.

This section includes this information:

• Preparing to Download or Upload a Configuration File By Using RCP, page B-15
• Downloading a Configuration File By Using RCP, page B-16
• Uploading a Configuration File By Using RCP, page B-17

Preparing to Download or Upload a Configuration File By Using RCP

Before you begin downloading or uploading a configuration file by using RCP, do these tasks:

• Ensure that the workstation acting as the RCP server supports the remote shell (rsh).

• Ensure that the switch has a route to the RCP server. The switch and the server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the RCP server by using the `ping` command.

• If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current RCP username is the one that you want to use for the RCP download. You can enter the `show users` privileged EXEC command to view the valid username. If you do not want to use this username, create a new RCP username by using the `ip rcmd remote-username username` global configuration command to be used during all copy operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the RCP username. Include the username in the `copy` command if you want to specify a username for only that copy operation.

• When you upload a file to the RCP server, it must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server. For example, suppose that the switch contains these configuration lines:

  ```
  hostname Switch1
  ip rcmd remote-username User0
  ```

  If the switch IP address translates to `Switch1.company.com`, the .rhosts file for User0 on the RCP server should contain this line:

  ```
  Switch1.company.com Switch1
  ```

  For more information, see the documentation for your RCP server.
## Downloading a Configuration File By Using RCP

Beginning in privileged EXEC mode, follow these steps to download a configuration file by using RCP:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Verify that the RCP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using RCP” section on page B-15.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Log into the switch through a Telnet session.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter global configuration mode. This step is required only if you override the default remote username (see Steps 4 and 5).</td>
</tr>
<tr>
<td>Step 4</td>
<td>(Optional) Specify the remote username.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Using RCP, copy the configuration file from a network server to the running configuration or to the startup configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to copy a configuration file named `host1-config` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 and load and run those commands on the switch:

```
Switch# copy rcp://netadmin1@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config:![OK]
Switch#
%SYS-5-CONFIG: Configured from host1-config by rcp from 172.16.101.101
```

This example shows how to specify a remote username of `netadmin1`. Then it copies the configuration file `host2-config` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 to the startup configuration:

```
Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin1
Switch(config)# end
Switch# copy rcp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[trt2-config]? host2-config
Configure using host2-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config:![OK]
[OK]
Switch#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by rcp from 172.16.101.101
```
Uploading a Configuration File By Using RCP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using RCP:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Verify that the RCP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using RCP” section on page B-15.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Log into the switch through a Telnet session.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enter global configuration mode. This step is required only if you override the default remote username (see Steps 4 and 5).</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) Specify the remote username.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Using RCP, copy the configuration file from a switch running or startup configuration file to a network server.</td>
</tr>
</tbody>
</table>

This example shows how to copy the running configuration file named switch2-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

Switch# copy system:running-config rcp://netadmin1@172.16.101.101/switch2-config
Write file switch-conf on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Switch#

This example shows how to store a startup configuration file on a server:

Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin2
Switch(config)# end
Switch# copy nvram:startup-config rcp://[username@location]/directory/filename
Remote host[?] 172.16.101.101
Name of configuration file to write [switch2-config]?
Write file switch2-config on host 172.16.101.101?[confirm]
[OK]

Clearing Configuration Information

You can clear the configuration information from the startup configuration. If you reboot the switch with no startup configuration, the switch enters the setup program so that you can reconfigure the switch with all new settings.

Clearing the Startup Configuration File

To clear the contents of your startup configuration, use the **erase nvram**: or the **erase startup-config** privileged EXEC command.
Caution
You cannot restore the startup configuration file after it has been deleted.

Deleting a Stored Configuration File

To delete a saved configuration from flash memory, use the `delete flash:filename` privileged EXEC command. Depending on the setting of the `file prompt` global configuration command, you might be prompted for confirmation before you delete a file. By default, the switch prompts for confirmation on destructive file operations. For more information about the `file prompt` command, see the *Cisco IOS Command Reference for Release 12.1*.

Caution
You cannot restore a file after it has been deleted.

Working with Software Images

This section describes how to archive (download and upload) software image files, which contain the system software, Cisco IOS code, and the embedded device manager software.

You can download a switch image file from a TFTP, FTP, or RCP server to upgrade the switch software.

You can replace the current image with the new one or keep the current image in flash memory after a download.

You upload a switch image file to a TFTP, FTP, or RCP server for backup purposes. You can use this uploaded image for future downloads to the same switch or another of the same type.

The protocol that you use depends on which type of server that you are using. The FTP and RCP transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because FTP and RCP are built on and use the TCP/IP stack, which is connection-oriented.

This section includes this information:

- Image Location on the Switch, page B-18
- tar File Format of Images on a Server or .com, page B-19
- Copying Image Files By Using TFTP, page B-20
- Copying Image Files By Using FTP, page B-22
- Copying Image Files By Using RCP, page B-26

Note
For a list of software images and the supported upgrade paths, see the release notes.

Image Location on the Switch

The software image is stored as a `.bin` file in a directory that shows the version number. A subdirectory contains the HTML files needed for web management. The image is stored on the system board flash memory (flash:).
You can use the `show version` privileged EXEC command to see the software version that is currently running on your switch. In the display, check the line that begins with `System image file is...`. It shows the directory name in flash memory where the image is stored.

You can also use the `dir filesystem:` privileged EXEC command to see the directory names of other software images you might have stored in flash memory.

## tar File Format of Images on a Server or .com

Software images located on a server or downloaded from .com are provided in a tar file format, which contains these files:

- **info file**
  The info file is always at the beginning of the tar file and has information about the files within it.
- **Cisco IOS image**
- **Web management files needed by the HTTP server on the switch**
- **LRE binary files needed for the proper functioning of LRE interfaces and LRE CPE devices.**
- **info.ver file**
  The info.ver file is always at the end of the tar file and has the same information as the info file. Because it is the last file in the tar file, its existence means that all files in the image have been downloaded.

This example shows the information in the info and info.ver files:

```
version_suffix: i6k212q4-121-19.EA1
version_directory: c29501re-16k212q4-mz.121-19.16.EA1
image_name: c29501re-16k212q4-mz.121-19.16.EA1.bin
ios_image_file_size: 3214848
total_image_file_size: 4719616
image_feature: LAYER_2|MIN_DRAM_MEG=32
image_family: C2950lre
info_end:
```

### Table B-3 info and info.ver File Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version_suffix</td>
<td>Specifies the software image version string suffix</td>
</tr>
<tr>
<td>version_directory</td>
<td>Specifies the directory where the software image and the HTML subdirectory are installed</td>
</tr>
<tr>
<td>image_name</td>
<td>Specifies the name of the software image within the tar file</td>
</tr>
<tr>
<td>ios_image_file_size</td>
<td>Specifies the software image size in the tar file, which is an approximate measure of how much flash space is required to hold just the software image</td>
</tr>
<tr>
<td>total_image_file_size</td>
<td>Specifies the size of all the images (the software image and the HTML files) in the tar file, which is an approximate measure of how much flash space is required to hold them</td>
</tr>
<tr>
<td>image_feature</td>
<td>Describes the core functionality of the image</td>
</tr>
<tr>
<td>image_family</td>
<td>Describes the family of products on which the software can be installed</td>
</tr>
<tr>
<td>image_min_dram</td>
<td>Specifies the minimum amount of DRAM needed to run this image</td>
</tr>
</tbody>
</table>
Copying Image Files By Using TFTP

You can download a switch image from a TFTP server or upload the image from the switch to a TFTP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes; this uploaded image can be used for future downloads to the same or another switch of the same type.

This section includes this information:
- Preparing to Download or Upload an Image File By Using TFTP, page B-20
- Downloading an Image File By Using TFTP, page B-21
- Uploading an Image File By Using TFTP, page B-22

Preparing to Download or Upload an Image File By Using TFTP

Before you begin downloading or uploading an image file by using TFTP, do these tasks:

- Ensure that the workstation acting as the TFTP server is properly configured. On a Sun workstation, make sure that the /etc/inetd.conf file contains this line:

  tftp dgram udp wait root /usr/etc/in.tftpd in.tftpd -p -s /tftpboot

  Make sure that the /etc/services file contains this line:

  tftp 69/udp

  Note  You must restart the inetd daemon after modifying the /etc/inetd.conf and /etc/services files. To restart the daemon, either stop the inetd process and restart it, or enter a fastboot command (on the SunOS 4.x) or a reboot command (on Solaris 2.x or SunOS 5.x). For more information on the TFTP daemon, see the documentation for your workstation.

- Ensure that the switch has a route to the TFTP server. The switch and the TFTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the TFTP server by using the ping command.

- Ensure that the image to be downloaded is in the correct directory on the TFTP server (usually /tftpboot on a UNIX workstation).

- For download operations, ensure that the permissions on the file are set correctly. The permission on the file should be world-read.

- Before uploading the image file, you might need to create an empty file on the TFTP server. To create an empty file, enter the touch filename command, where filename is the name of the file you will use when uploading the image to the server.

- During upload operations, if you are overwriting an existing file (including an empty file, if you had to create one) on the server, ensure that the permissions on the file are set correctly. Permissions on the file should be world-write.
**Downloading an Image File By Using TFTP**

You can download a new image file and replace the current image or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 3 to download a new image from a TFTP server and overwrite the existing image. To keep the current image, omit Step 3.

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy the image to the appropriate TFTP directory on the workstation. Make sure that the TFTP server is properly configured; see the “Preparing to Download or Upload an Image File By Using TFTP” section on page B-20.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log into the switch through a Telnet session.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Download the image file from the TFTP server to the switch, and overwrite the current image.  
  - The `/overwrite` option overwrites the software image in flash with the downloaded image.  
  - The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.  
  - For `/location`, specify the IP address of the TFTP server.  
  - For `/directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive. |
| `archive download-sw /overwrite /reload`  
| `tftp://[location]/directory/image-name.tar` |

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Download the image file from the TFTP server to the switch, and keep the current image.  
  - The `/leave-old-sw` option keeps the old software version after a download.  
  - The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.  
  - For `/location`, specify the IP address of the TFTP server.  
  - For `/directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive. |
| `archive download-sw /leave-old-sw /reload`  
| `tftp://[location]/directory/image-name.tar` |

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it stops the process and reports an error. If you specify the `/overwrite` option, the download algorithm removes the existing image on the flash device whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note**

If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the `/overwrite` option. The Catalyst 2950 LRE switch supports only one complete set of Cisco IOS, HTML, LRE binary files, and one Cisco IOS binary file on the flash device. You cannot have two complete image sets on the flash device.
Working with Software Images

If you specify the /leave-old-sw, the existing files are not removed. If there is not enough space to install the new image and keep the current running image, the download process stops, and an error message appears.

The algorithm installs the downloaded image on the system board flash device (flash:). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old image during the download process (you specified the /leave-old-sw keyword), you can remove it by entering the delete /force /recursive filesystem:/file-url privileged EXEC command. For filesystem, use flash: for the system board flash device. For file-url, enter the directory name of the old image. All the files in the directory and the directory are removed.

Caution
For the download and upload algorithms to operate properly, do not rename image names.

Uploading an Image File By Using TFTP

You can upload an image from the switch to a TFTP server. You can later download this image to the switch or to another switch of the same type.

Use the upload feature only if the HTML pages associated with the device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to a TFTP server:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Make sure that the TFTP server is properly configured; see the “Preparing to Download or Upload an Image File By Using TFTP” section on page B-20.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Log into the switch through a Telnet session.</td>
</tr>
<tr>
<td>Step 3 archive upload-sw</td>
<td>Upload the currently running switch image to the TFTP server.</td>
</tr>
<tr>
<td>tftp:/[//location]/directory/image-name.tar</td>
<td>- For //location, specify the IP address of the TFTP server.</td>
</tr>
<tr>
<td></td>
<td>- For /directory/image-name.tar, specify the directory (optional)</td>
</tr>
<tr>
<td></td>
<td>and the name of the software image to be uploaded. Directory</td>
</tr>
<tr>
<td></td>
<td>and image names are case sensitive. The image-name.tar is the name of</td>
</tr>
<tr>
<td></td>
<td>the software image to be stored on the server.</td>
</tr>
</tbody>
</table>

The archive upload-sw privileged EXEC command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, the HTML files, LRE binary files, and info.ver. After these files are uploaded, the upload algorithm creates the tar file format.

Caution
For the download and upload algorithms to operate properly, do not rename image names.

Copying Image Files By Using FTP

You can download a switch image from an FTP server or upload the image from the switch to an FTP server.
You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes. You can use this uploaded image for future downloads to the switch or another switch of the same type.

This section includes this information:
- Preparing to Download or Upload an Image File By Using FTP, page B-23
- Downloading an Image File By Using FTP, page B-24
- Uploading an Image File By Using FTP, page B-25

Preparing to Download or Upload an Image File By Using FTP

You can copy images files to or from an FTP server.

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy an image file from the switch to a server by using FTP, the software sends the first valid username in this list:
- The username specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a username is specified.
- The username set by the `ip ftp username` global configuration command if the command is configured.
- Anonymous.

The switch sends the first valid password in this list:
- The password specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a password is specified.
- The password set by the `ip ftp password` global configuration command if the command is configured.
- The switch forms a password named `username@switchname.domain`. The variable `username` is the username associated with the current session, `switchname` is the configured host name, and `domain` is the domain of the switch.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from you.

Use the `ip ftp username` and `ip ftp password` commands to specify a username and password for all copies. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username only for that operation.

If the server has a directory structure, the image file is written to or copied from the directory associated with the username on the server. For example, if the image file resides in the home directory of a user on the server, specify that user's name as the remote username.

Before you begin downloading or uploading an image file by using FTP, do these tasks:
- Ensure that the switch has a route to the FTP server. The switch and the FTP server must be in the same subnet if you do not have a router to route traffic between subnets. Check connectivity to the FTP server by using the `ping` command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current FTP username is the one that you want to use for the FTP download. You can enter the `show users` privileged EXEC command to view the valid username. If you do not want to use this username, create a new FTP username by using the `ip ftp username`
username global configuration command. This new name will be used during all archive operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the FTP username. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username for that operation only.

- When you upload an image file to the FTP server, it must be properly configured to accept the write request from the user on the switch.

For more information, see the documentation for your FTP server.

### Downloading an Image File By Using FTP

You can download a new image file and overwrite the current image or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 7 to download a new image from an FTP server and overwrite the existing image. To keep the current image, omit Step 7.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Verify that the FTP server is properly configured by referring to the “Preparing to Download or Upload an Image File By Using FTP” section on page B-23.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>configure terminal</code> Enter global configuration mode. This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>ip ftp username username</code> (Optional) Change the default remote username.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>ip ftp password password</code> (Optional) Change the default password.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><code>archive download-sw /overwrite /reload ftp://[ilename-name.tar]</code> Download the image file from the FTP server to the switch, and overwrite the current image.</td>
</tr>
</tbody>
</table>

- The `/overwrite` option overwrites the software image in flash with the downloaded image.
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For `//username[:password]@location[/directory]/image-name.tar`, specify the username and password; these must be associated with an account on the FTP server. For more information, see the “Preparing to Download or Upload an Image File By Using FTP” section on page B-23.
- For `@location`, specify the IP address of the FTP server.
- For `directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive.
Appendix B  Working with the Cisco IOS File System, Configuration Files, and Software Images

Working with Software Images

Working with Software Images

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it stops the process and reports an error. If you specify the `/overwrite` option, the download algorithm removes the existing image on the flash device, whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note**
If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the `/overwrite` option.

If you specify the `/leave-old-sw`, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message appears.

The algorithm installs the downloaded image onto the system board flash device (flash:). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old image during the download process (you specified the `/leave-old-sw` keyword), you can remove it by entering the `delete /force /recursive filesystem:/file-url` privileged EXEC command. For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the directory name of the old software image. All the files in the directory and the directory are removed.

**Caution**
For the download and upload algorithms to operate properly, do not rename image names.

### Uploading an Image File By Using FTP

You can upload an image from the switch to an FTP server. You can later download this image to the same switch or to another switch of the same type.

Use the upload feature only if the HTML pages associated with the device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to an FTP server:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 8</td>
<td></td>
</tr>
<tr>
<td>archive download-sw /leave-old-sw /reload ftp:[//username[:password]@location]/directory/image-name.tar</td>
<td>Download the image file from the FTP server to the switch, and keep the current image.</td>
</tr>
<tr>
<td></td>
<td>- The <code>/leave-old-sw</code> option keeps the old software version after a download.</td>
</tr>
<tr>
<td></td>
<td>- The <code>/reload</code> option reloads the system after downloading the image unless the configuration has been changed and not been saved.</td>
</tr>
<tr>
<td></td>
<td>- For <code>//username[:password]</code>, specify the username and password. These must be associated with an account on the FTP server.</td>
</tr>
<tr>
<td></td>
<td>- For <code>@location</code>, specify the IP address of the FTP server.</td>
</tr>
<tr>
<td></td>
<td>- For <code>directory/image-name.tar</code>, specify the directory (optional) and the image to download. Directory and image names are case sensitive.</td>
</tr>
</tbody>
</table>
### Working with Software Images

#### Command

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>Verify that the FTP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using FTP” section on page B-12.</td>
</tr>
<tr>
<td>2</td>
<td></td>
<td>Log into the switch through a Telnet session.</td>
</tr>
<tr>
<td>3</td>
<td>configure terminal</td>
<td>Enter global configuration mode. This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).</td>
</tr>
<tr>
<td>4</td>
<td>ip ftp username username</td>
<td>(Optional) Change the default remote username.</td>
</tr>
<tr>
<td>5</td>
<td>ip ftp password password</td>
<td>(Optional) Change the default password.</td>
</tr>
<tr>
<td>6</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
| 7    | archive upload-sw ftp://[username[:password]@[location]]/directory/image-name.tar | Upload the currently running switch image to the FTP server.  
- For I[username]:password, specify the username and password. These must be associated with an account on the FTP server. For more information, see the “Preparing to Download or Upload an Image File By Using FTP” section on page B-23.  
- For @location, specify the IP address of the FTP server.  
- For Idirectory/image-name.tar, specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive. The image-name.tar is the name of the software image to be stored on the server. |

The **archive upload-sw** command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, the HTML files, and info.ver. After these files are uploaded, the upload algorithm creates the tar file format.

! Caution  
For the download and upload algorithms to operate properly, do not rename image names.

### Copying Image Files By Using RCP

You can download a switch image from an RCP server or upload the image from the switch to an RCP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes. You can use this uploaded image for future downloads to the same switch or another of the same type.

This section includes this information:

- Preparing to Download or Upload an Image File By Using RCP, page B-27
- Downloading an Image File By Using RCP, page B-28
- Uploading an Image File By Using RCP, page B-30
Preparing to Download or Upload an Image File By Using RCP

RCP provides another method of downloading and uploading image files between remote hosts and the switch. Unlike TFTP, which uses User Datagram Protocol (UDP), a connectionless protocol, RCP uses TCP, which is connection-oriented.

To use RCP to copy files, the server from or to which you will be copying files must support RCP. The RCP copy commands rely on the rsh server (or daemon) on the remote system. To copy files by using RCP, you do not need to create a server for file distribution as you do with TFTP. You only need to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, RCP creates it for you.

RCP requires a client to send a remote username on each RCP request to a server. When you copy an image from the switch to a server by using RCP, the software sends the first valid username in this list:

- The username specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a username is specified.
- The username set by the `ip rcmd remote-username username` global configuration command if the command is entered.
- The remote username associated with the current TTY (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the `username` command, the switch software sends the Telnet username as the remote username.
- The switch host name.

For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. If the server has a directory structure, the image file is written to or copied from the directory associated with the remote username on the server. For example, if the image file resides in the home directory of a user on the server, specify that user’s name as the remote username.

Before you begin downloading or uploading an image file by using RCP, do these tasks:

- Ensure that the workstation acting as the RCP server supports the remote shell (rsh).
- Ensure that the switch has a route to the RCP server. The switch and the server must be in the same subnet if you do not have a router to route traffic between subnets. Check connectivity to the RCP server by using the `ping` command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current RCP username is the one that you want to use for the RCP download. You can enter the `show users` privileged EXEC command to view the valid username. If you do not want to use this username, create a new RCP username by using the `ip rcmd remote-username username` global configuration command to be used during all archive operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and there is no need to set the RCP username. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username only for that operation.
- When you upload an image to the RCP to the server, it must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server. For example, suppose the switch contains these configuration lines:
  
  ```
  hostname Switch1
  ip rcmd remote-username User0
  ```

If the switch IP address translates to Switch1.company.com, the .rhosts file for User0 on the RCP server should contain this line:

Switch1.company.com Switch1

For more information, see the documentation for your RCP server.

**Downloading an Image File By Using RCP**

You can download a new image file and replace or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 6 to download a new image from an RCP server and overwrite the existing image. To keep the current image, omit Step 6.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Verify that the RCP server is properly configured by referring to the “Preparing to Download or Upload an Image File By Using RCP” section on page B-27.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
<tr>
<td><strong>Step 3</strong> configure terminal</td>
<td>Enter global configuration mode. This step is required only if you override the default remote username (see Steps 4 and 5).</td>
</tr>
<tr>
<td><strong>Step 4</strong> ip rcmd remote-username <strong>username</strong></td>
<td>(Optional) Specify the remote username.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Working with Software Images

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it stops the process and reports an error. If you specify the `/overwrite` option, the download algorithm removes the existing image on the flash device whether or not it is the same as the new one, downloads the new image, and then reloads the software.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 6** archive download-sw /overwrite /reload rcp://[username@location]/directory/image-name.tar | Download the image file from the RCP server to the switch, and overwrite the current image.  
- The `/overwrite` option overwrites the software image in flash with the downloaded image.  
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.  
- For `/username`, specify the username. For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. For more information, see the “Preparing to Download or Upload an Image File By Using RCP” section on page B-27.  
- For `@location`, specify the IP address of the RCP server.  
- For `/directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive. |
| **Step 7** archive download-sw /leave-old-sw /reload rcp://[username@location]/directory/image-name.tar | Download the image file from the RCP server to the switch, and keep the current image.  
- The `/leave-old-sw` option keeps the old software version after a download.  
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.  
- For `/username`, specify the username. For the RCP copy request to execute, an account must be defined on the network server for the remote username. For more information, see the “Preparing to Download or Upload an Image File By Using RCP” section on page B-27.  
- For `@location`, specify the IP address of the RCP server.  
- For `/directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive. |

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it stops the process and reports an error. If you specify the `/overwrite` option, the download algorithm removes the existing image on the flash device whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note**

If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the `/overwrite` option.

If you specify the `/leave-old-sw`, the existing files are not removed. If there is not enough room to install the new image an keep the running image, the download process stops, and an error message appears.
The algorithm installs the downloaded image onto the system board flash device (flash:). The image is placed in a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old software during the download process (you specified the /leave-old-sw keyword), you can remove it by entering the `delete /force /recursive filesystem:/file-url` privileged EXEC command. For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the directory name of the old software image. All the files in the directory and the directory are removed.

**Caution**

For the download and upload algorithms to operate properly, do not rename image names.

### Uploading an Image File By Using RCP

You can upload an image from the switch to an RCP server. You can later download this image to the same switch or to another switch of the same type.

The upload feature should be used only if the HTML pages associated with the device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to an RCP server:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Verify that the RCP server is properly configured by referring to the “Preparing to Download or Upload an Image File By Using RCP” section on page B-27.</td>
<td></td>
</tr>
<tr>
<td>Step 2 Log into the switch through a Telnet session.</td>
<td></td>
</tr>
<tr>
<td>Step 3 <code>configure terminal</code> Enter global configuration mode. This step is required only if you override the default remote username (see Steps 4 and 5).</td>
<td></td>
</tr>
<tr>
<td>Step 4 <code>ip rcmd remote-username username</code> (Optional) Specify the remote username.</td>
<td></td>
</tr>
<tr>
<td>Step 5 <code>end</code> Return to privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>Step 6 <code>archive upload-sw rcp://[[username@]]location/directory/image-name.tar]</code> Upload the currently running switch image to the RCP server.</td>
<td></td>
</tr>
</tbody>
</table>

- For `username`, specify the username; for the RCP copy request to execute, an account must be defined on the network server for the remote username. For more information, see the “Preparing to Download or Upload an Image File By Using RCP” section on page B-27.
- For `@location`, specify the IP address of the RCP server.
- For `directory/image-name.tar`, specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive.
- The `image-name.tar` is the name of software image to be stored on the server.
The `archive upload-sw` privileged EXEC command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, the HTML files, and info.ver. After these files are uploaded, the upload algorithm creates the tar file format.

**Caution**

For the download and upload algorithms to operate properly, do *not* rename image names.
