

Telecommunications System

MAJOR COMPONENTS

The Mobile Surgery Unit™ (MSU) comes equipped with multiple-line communication to the rest of the world via land-line connections.

Each patient care station is also equipped with a fax port and a data port. The unit is designed to have a laptop computer at each patient care station. The fax port at each station provides access to the external world via fax transmission. The data port provides a link to the central file server, enabling each laptop to be a node on a local area network (LAN) within the MSU. Standard connections are used so the owner may use the computers of their choice.
